3.1 File List

Here is a list of all documented files with brief descriptions:

Chapter 4

Class Documentation

4.1 AuxConfiguration Class Reference

Class for storing the auxilliary configuration parameters.

```
#include <Configuration.hpp>
```

Public Member Functions

- AuxConfiguration (int argc, char ∗∗argv)

    Default constructor.
- AuxConfiguration (const std::vector< std::string > &aArgs)

    Constructor which parses the parameters when passed in as commandline arguments.
- void SetValidate (const bool &aValidate)

    Set whether to validate clusterization.
- void SetInputFile (const std::string &aFileName)

    Setter for the input file.
- void SetOutputFile (const std::string &aFileName)

    Setter for the output file.
- void SetConfigFile (const std::string &aFileName)

    Setter for the config file.
- const bool & validate () const

    Getter for whether or not to run the validation on the clustering.
- const std::string & inputFile () const

    Getter for the input file.
- const std::string & outputFile () const

    Getter for the output file.
- const std::string & configFile () const

    Getter for the config file.
- const double & ClusterR () const

    Getter for the R value for a clusterization pass.
- const double & ClusterT () const

    Getter for the T value for a clusterization pass.

Public Attributes

- bool mValidate

  Whether or not to run the validation on the clustering.
- std::string mInputFile

  The input RoI file.
- std::string mOutputFile

  The output file.
- std::string mConfigFile

  The config file.
- double mClusterR

  The value of R for clustering.
- double mClusterT

  The value of T for clustering.

Private Member Functions

- void FromVector (const std::vector< std::string > &aArgs)

  Parse the parameters when passed in as commandline arguments.

4.1.1 Detailed Description

Class for storing the auxilliary configuration parameters.

Definition at line 263 of file Configuration.hpp.

4.1.2 Constructor & Destructor Documentation

4.1.2.1 AuxConfiguration() [1/2]

```
AuxConfiguration::AuxConfiguration (
            int argc,
            char ** argv )
```

Default constructor.

Constructor which parses the parameters when passed in as commandline arguments

Parameters

argc	The number of commandline arguments
argv	The commandline arguments

Definition at line 214 of file Configuration.cpp.

References FromVector().

4.1.2.2 AuxConfiguration() **[2/2]**

```
AuxConfiguration::AuxConfiguration (
            const std::vector< std::string > & aArgs )
```

Constructor which parses the parameters when passed in as commandline arguments.

Parameters

aArgs	The commandline arguments

Definition at line 223 of file Configuration.cpp.

References FromVector().

4.1.3 Member Function Documentation

4.1.3.1 ClusterR()

```
const double& AuxConfiguration::ClusterR ( ) const  [inline]
```

Getter for the R value for a clusterization pass.

Returns

The R value for a clusterization pass

Definition at line 323 of file Configuration.hpp.

References mClusterR.

Referenced by main().

4.1.3.2 ClusterT()

```
const double& AuxConfiguration::ClusterT ( ) const  [inline]
```

Getter for the T value for a clusterization pass.

Returns

The T value for a clusterization pass

Definition at line 330 of file Configuration.hpp.

References mClusterT.

Referenced by main().

4.1.3.3 configFile()

```
const std::string& AuxConfiguration::configFile ( ) const  [inline]
```

Getter for the config file.

Returns

The name of the config file

Definition at line 316 of file Configuration.hpp.

References mConfigFile.

Referenced by main().

4.1.3.4 FromVector()

```
void AuxConfiguration::FromVector (
            const std::vector< std::string > & aArgs )  [private]
```

Parse the parameters when passed in as commandline arguments.

Parameters

aArgs	The commandline arguments

Definition at line 262 of file Configuration.cpp.

References mClusterR, mClusterT, Nthreads, SetConfigFile(), SetInputFile(), SetOutputFile(), SetValidate(), and StrToDist().

Referenced by AuxConfiguration().

4.1.3.5 inputFile()

```
const std::string& AuxConfiguration::inputFile ( ) const  [inline]
```

Getter for the input file.

Returns

The name of the input RoI file

Definition at line 302 of file Configuration.hpp.

References mInputFile.

Referenced by main().

4.1.3.6 outputFile()

```
const std::string& AuxConfiguration::outputFile ( ) const  [inline]
```

Getter for the output file.

Returns

The name of the output file

Definition at line 309 of file Configuration.hpp.

References mOutputFile.

Referenced by main().

4.1.3.7 SetConfigFile()

```
void AuxConfiguration::SetConfigFile (
            const std::string & aFileName )
```

Setter for the config file.

Parameters

| aFileName | The name of the file |

Definition at line 250 of file Configuration.cpp.

References mConfigFile.

Referenced by FromVector().

4.1.3.8 SetInputFile()

```
void AuxConfiguration::SetInputFile (
            const std::string & aFileName )
```

Setter for the input file.

Parameters

| aFileName | The name of the file |

Definition at line 237 of file Configuration.cpp.

References mInputFile.

Referenced by FromVector().

4.1.3.9 SetOutputFile()

```
void AuxConfiguration::SetOutputFile (
            const std::string & aFileName )
```

Setter for the output file.

Parameters

aFileName	The name of the file

Definition at line 243 of file Configuration.cpp.

References mOutputFile.

Referenced by FromVector().

4.1.3.10 SetValidate()

```
void AuxConfiguration::SetValidate (
            const bool & aValidate )
```

Set whether to validate clusterization.

Parameters

aValidate	Whether to validate clusterization

Definition at line 231 of file Configuration.cpp.

References mValidate.

Referenced by FromVector().

4.1.3.11 validate()

```
const bool& AuxConfiguration::validate ( ) const   [inline]
```

Getter for whether or not to run the validation on the clustering.

Returns

   Whether or not to run the validation on the clustering

Definition at line 295 of file Configuration.hpp.

References mValidate.

The documentation for this class was generated from the following files:

- include/BayesianClustering/Configuration.hpp
- src/BayesianClustering/Configuration.cpp

4.2   Cluster Class Reference

A class representing a cluster.

```
#include <Cluster.hpp>
```

Collaboration diagram for Cluster:

Classes

- struct Parameter

   A struct representing the cluster parameters.

Public Member Functions

- Cluster (const std::size_t &aParamSize)

   Default constructor.

- Cluster (const Data &aData, const std::vector< double > &aSigmabins2)

   Construct a cluster from a single data-point.

- Cluster (const Cluster &aOther)=delete

   Deleted copy constructor.

- Cluster & operator= (const Cluster &aOther)=delete

   Deleted assignment operator.

- Cluster (Cluster &&aOther)=default

   Default move constructor.

- Cluster & operator= (Cluster &&aOther)=default

   Default move-assignment constructor.

- ∼Cluster ()

   Default destructor.

- Cluster & operator+= (const Cluster &aOther)

   Add another cluster to this one.

- Cluster ∗ GetParent ()

   Get a pointer to this cluster's ultimate parent.

- void UpdateLogScore (const ScanConfiguration &aScanConfig)

   Update log-probability after a scan.

Public Attributes

- std::vector< Parameter > mParams

    The collection of parameters, each corresponding to a different sigma hypothesis.
- std::size_t mClusterSize

    The number of points in the current cluster.
- std::size_t mLastClusterSize

    The number of points in the cluster on the previous scan iteration.
- PRECISION mClusterScore

    The log-probability of the current cluster.
- Cluster ∗ mParent

    A pointer to the immediate parent of the current cluster.
- std::vector< Data ∗ > mData

    List of points in the cluster after clustering.

4.2.1 Detailed Description

A class representing a cluster.

Definition at line 16 of file Cluster.hpp.

4.2.2 Constructor & Destructor Documentation

4.2.2.1 Cluster() [1/4]

```
Cluster::Cluster (
            const std::size_t & aParamSize )
```

Default constructor.

Parameters

aParamSize	The number of sigma-bins

Definition at line 93 of file Cluster.cpp.

4.2.2.2 Cluster() [2/4]

```
Cluster::Cluster (
            const Data & aData,
            const std::vector< double > & aSigmabins2 )
```

Construct a cluster from a single data-point.

Parameters

aData	A data-point with which to initialize the cluster
aSigmabins2	The sigma-bins for initializing clusters

Definition at line 99 of file Cluster.cpp.

References mParams, Data::r2, Data::s, Data::x, and Data::y.

4.2.2.3   Cluster() [3/4]

```
Cluster::Cluster (
              const Cluster & aOther )   [delete]
```

Deleted copy constructor.

Parameters

aOther	Anonymous argument

4.2.2.4   Cluster() [4/4]

```
Cluster::Cluster (
              Cluster && aOther )   [default]
```

Default move constructor.

Parameters

aOther	Anonymous argument

4.2.3   Member Function Documentation

4.2.3.1   GetParent()

```
Cluster * Cluster::GetParent ( )
```

Get a pointer to this cluster's ultimate parent.

Returns

A pointer to this cluster's ultimate parent

Definition at line 165 of file Cluster.cpp.

References GetParent(), and mParent.

Referenced by DataProxy::GetCluster(), and GetParent().

4.2.3.2 operator+=()

```
Cluster & Cluster::operator+= (
            const Cluster & aOther )
```

Add another cluster to this one.

Parameters

aOther	Another cluster of parameters to add to this one

Returns

Reference to this, for chaining calls

Definition at line 155 of file Cluster.cpp.

References mClusterSize, and mParams.

4.2.3.3 operator=() [1/2]

```
Cluster& Cluster::operator= (
            Cluster && aOther )  [default]
```

Default move-assignment constructor.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.2.3.4 operator=() `[2/2]`

```
Cluster& Cluster::operator= (
              const Cluster & aOther )  [delete]
```

Deleted assignment operator.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.2.3.5 UpdateLogScore()

```
void Cluster::UpdateLogScore (
              const ScanConfiguration & aScanConfig )
```

Update log-probability after a scan.

Parameters

aScanConfig	The configuration parameters for the scan

Definition at line 124 of file Cluster.cpp.

References ScanConfiguration::log_probability_sigma(), mClusterScore, mClusterSize, mLastClusterSize, m←
Params, and ScanConfiguration::sigmabins().

The documentation for this class was generated from the following files:

- include/BayesianClustering/Cluster.hpp
- src/BayesianClustering/Cluster.cpp

4.3 ClusterWrapper Struct Reference

A struct for storing a result of an individual scan configuration.

```
#include <API.hpp>
```

Public Member Functions

- bool operator== (const ClusterWrapper &aOther)

    Equality operator required by boost python.

Public Attributes

- std::size_t localizations

  The number of localizations in the cluster.
- long double area

  The area of the spanning convex hull.
- long double perimeter

  The perimeter of the spanning convex hull.
- double centroid_x

  The x-position of the centroid.
- double centroid_y

  The y-position of the centroid.

4.3.1 Detailed Description

A struct for storing a result of an individual scan configuration.

Definition at line 44 of file API.hpp.

4.3.2 Member Function Documentation

4.3.2.1 operator==()

```
bool ClusterWrapper::operator== (
            const ClusterWrapper & aOther )  [inline]
```

Equality operator required by boost python.

Returns

Whether we are equal to the other

Parameters

aOther	Another ClusterWrapper to compare against

Definition at line 54 of file API.hpp.

References centroid_x, and centroid_y.

The documentation for this struct was generated from the following file:

- include/BayesianClustering/API.hpp

4.4 Data Class Reference

A class to store the raw data-points.

```
#include <Data.hpp>
```

Collaboration diagram for Data:
Public Member Functions

- Data (const PRECISION &aX, const PRECISION &aY, const PRECISION &aS)

    Constructor.
- Data (const Data &aOther)=delete

    Deleted copy constructor.
- Data & operator= (const Data &aOther)=delete

    Deleted assignment operator.
- Data (Data &&aOther)=default

    Default move constructor.
- Data & operator= (Data &&aOther)=default

    Default move-assignment constructor.
- virtual ∼Data ()

    Destructor.
- bool operator< (const Data &aOther) const

    Comparison operator for sorting data-points by distance from the origin.
- PRECISION dR2 (const Data &aOther) const

    Return the squared-distance of this data-points from another.
- PRECISION dR (const Data &aOther) const

    Return the distance of this data-points from another.
- PRECISION dPhi (const Data &aOther) const

    Return the angle between this data-points and another.
- void Preprocess (std::vector< Data > &aData, const std::size_t &aIndex, const double &aMax2R, const double &aMax2R2, const std::vector< double > &aSigmabins2, ProgressBar &aProgressBar)

    All the necessary pre-processing to get this data-point ready for an RT-scan.
- void PreprocessLocalizationScores (std::vector< Data > &aData, const ScanConfiguration &aScanConfig, const double &aArea)

    Calculate the localization score from the local neighbourhood.
- PRECISION CalculateLocalizationScore (const std::vector< Data > &aData, const double &R, const double &aArea) const

    Calculate the localization score from the local neighbourhood.

Public Attributes

- PRECISION x

  The x-position of the data-point.
- PRECISION y

  The y-position of the data-point.
- PRECISION s

  The sigma of the data-point.
- PRECISION r2

  The squared radial distance of the data-point.
- PRECISION r

  The radial distance of the data-point.
- PRECISION phi

  The phi-position of the data-point.
- std::vector< PRECISION > mLocalizationScores

  The locaalization scores, one per R-bin.
- std::vector< std::pair< PRECISION, std::size_t > > mNeighbours

  The list of neighbours as a pair of squared-distance and index into the list of points.
- Cluster ∗ mProtoCluster

  A cluster containing only this data-point.

4.4.1 Detailed Description

A class to store the raw data-points.

Definition at line 17 of file Data.hpp.

4.4.2 Constructor & Destructor Documentation

4.4.2.1 Data() [1/3]

```
Data::Data (
          const PRECISION & aX,
          const PRECISION & aY,
          const PRECISION & aS )
```

Constructor.

Parameters

aX	The x-position of the data-point in algorithm units
aY	The y-position of the data-point in algorithm units
aS	The sigma of the data-point in algorithm units

Definition at line 14 of file Data.cpp.

4.4.2.2 Data() [2/3]

```
Data::Data (
            const Data & aOther ) [delete]
```

Deleted copy constructor.

Parameters

aOther	Anonymous argument

4.4.2.3 Data() [3/3]

```
Data::Data (
            Data && aOther ) [default]
```

Default move constructor.

Parameters

aOther	Anonymous argument

4.4.3 Member Function Documentation

4.4.3.1 CalculateLocalizationScore()

```
PRECISION Data::CalculateLocalizationScore (
            const std::vector< Data > & aData,
            const double & R,
            const double & aArea ) const
```

Calculate the localization score from the local neighbourhood.

Todo Remind myself how this works and what the difference is with above

Parameters

aData	?
R	?
aArea	The area of the window for normalizing the log score

Returns

The localization score

Definition at line 106 of file Data.cpp.

References mNeighbours.

4.4.3.2 dPhi()

```
PRECISION Data::dPhi (
            const Data & aOther ) const  [inline]
```

Return the angle between this data-points and another.

Returns

The angle between this data-points and another

Parameters

aOther	A data-point to compare against

Definition at line 71 of file Data.hpp.

References phi.

4.4.3.3 dR()

```
PRECISION Data::dR (
            const Data & aOther ) const  [inline]
```

Return the distance of this data-points from another.

Returns

The distance of this data-points from another

Parameters

aOther	A data-point to compare against

Definition at line 63 of file Data.hpp.

References dR2().

4.4.3.4 dR2()

```
PRECISION Data::dR2 (
            const Data & aOther ) const  [inline]
```

Return the squared-distance of this data-points from another.

Returns

> The squared-distance of this data-points from another

Parameters

aOther	A data-point to compare against

Definition at line 54 of file Data.hpp.

References x, and y.

Referenced by dR().

4.4.3.5 operator<()

```
bool Data::operator< (
            const Data & aOther ) const  [inline]
```

Comparison operator for sorting data-points by distance from the origin.

Returns

> Whether this data-point is closer to the origin than another

Parameters

aOther	A data-point to compare against

Definition at line 46 of file Data.hpp.

References r.

4.4.3.6 operator=() [1/2]

```
Data& Data::operator= (
            const Data & aOther )  [delete]
```

Deleted assignment operator.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.4.3.7 operator=() [2/2]

```
Data& Data::operator= (
            Data && aOther )  [default]
```

Default move-assignment constructor.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.4.3.8 Preprocess()

```
void Data::Preprocess (
            std::vector< Data > & aData,
            const std::size_t & aIndex,
            const double & aMax2R,
            const double & aMax2R2,
            const std::vector< double > & aSigmabins2,
            ProgressBar & aProgressBar )
```

All the necessary pre-processing to get this data-point ready for an RT-scan.

Parameters

aData	The collection of data-points
aIndex	The index of the current data-point
aMax2R	Twice the maximum radius out to which we will cluster
aMax2R2	Square of twice the maximum radius out to which we will cluster
aSigmabins2	The sigma-bins for initializing clusters
aProgressBar	The progress bar to update

Definition at line 28 of file Data.cpp.

4.4.3.9 PreprocessLocalizationScores()

```
void Data::PreprocessLocalizationScores (
            std::vector< Data > & aData,
            const ScanConfiguration & aScanConfig,
            const double & aArea )
```

Calculate the localization score from the local neighbourhood.

Todo Remind myself how this works and what the difference is with below

Parameters

aData	?
aScanConfig	The configuration parameters for the scan
aArea	The area of the window for normalizing the log score

Definition at line 77 of file Data.cpp.

The documentation for this class was generated from the following files:

- include/BayesianClustering/Data.hpp
- src/BayesianClustering/Data.cpp

4.5 DataProxy Class Reference

A light-weight proxy for the raw data-points.

```
#include <DataProxy.hpp>
```

Collaboration diagram for DataProxy:
Public Member Functions

- DataProxy (Data &aData)

    Default constructor.
- DataProxy (const DataProxy &aOther)=delete

    Deleted copy constructor.
- DataProxy & operator= (const DataProxy &aOther)=delete

    Deleted assignment operator.
- DataProxy (DataProxy &&aOther)=default

    Default move constructor.
- DataProxy & operator= (DataProxy &&aOther)=default

    Default move-assignment constructor.
- void Clusterize (const PRECISION &a2R2, RoIproxy &aRoI)

    Entry point clusterization function - a new cluster will be created.
- void Clusterize (const PRECISION &a2R2, RoIproxy &aRoI, Cluster *aCluster, const std::size_t &d=0)

    Recursive clusterization function.
- Cluster * GetCluster ()

    Get a pointer to this data-proxy's ultimate parent cluster (or null if unclustered.

Public Attributes

- Data * mData

    The data-point for which this is the proxy.
- Cluster * mCluster

    This data-proxy's immediate parent cluster.
- bool mExclude

    Whether this data-point is to be included in the clusterization.

4.5.1   Detailed Description

A light-weight proxy for the raw data-points.

Definition at line 18 of file DataProxy.hpp.

4.5.2   Constructor & Destructor Documentation

4.5.2.1   DataProxy() [1/3]

```
DataProxy::DataProxy (
            Data & aData )
```

Default constructor.

Parameters

aData	The data-point for which this is the proxy

Definition at line 17 of file DataProxy.cpp.

4.5.2.2 DataProxy() [2/3]

```
DataProxy::DataProxy (
            const DataProxy & aOther )  [delete]
```

Deleted copy constructor.

Parameters

aOther	Anonymous argument

4.5.2.3 DataProxy() [3/3]

```
DataProxy::DataProxy (
            DataProxy && aOther )  [default]
```

Default move constructor.

Parameters

aOther	Anonymous argument

4.5.3 Member Function Documentation

4.5.3.1 Clusterize() [1/2]

```
void DataProxy::Clusterize (
            const PRECISION & a2R2,
            RoIproxy & aRoI )
```

Entry point clusterization function - a new cluster will be created.

Parameters

a2R2	The clusterization radius
aRoI	The RoI-proxy in which we are running

Definition at line 23 of file DataProxy.cpp.

References mCluster, RoIproxy::mClusters, mData, mExclude, Cluster::mParams, and Data::mProtoCluster.

Referenced by Clusterize().

4.5.3.2 Clusterize() [2/2]

```
void DataProxy::Clusterize (
            const PRECISION & a2R2,
            RoIproxy & aRoI,
            Cluster * aCluster,
            const std::size_t & d = 0 )
```

Recursive clusterization function.

Parameters

a2R2	The clusterization radius
aRoI	The RoI-proxy in which we are running
aCluster	The cluster we are building
d	The recursion depth

Definition at line 34 of file DataProxy.cpp.

References Clusterize(), GetCluster(), RoIproxy::GetData(), mCluster, Cluster::mClusterSize, mData, mExclude, Data::mNeighbours, Cluster::mParent, Data::mProtoCluster, and RECURSION_LIMIT.

4.5.3.3 GetCluster()

```
Cluster* DataProxy::GetCluster ( )    [inline]
```

Get a pointer to this data-proxy's ultimate parent cluster (or null if unclustered.

Returns

A pointer to this data-proxy's ultimate parent cluster

Definition at line 53 of file DataProxy.hpp.

References Cluster::GetParent(), and mCluster.

Referenced by Clusterize().

4.5.3.4 operator=() [1/2]

```
DataProxy& DataProxy::operator= (
            const DataProxy & aOther )    [delete]
```

Deleted assignment operator.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.5.3.5 operator=() **[2/2]**

```
DataProxy& DataProxy::operator= (
            DataProxy && aOther )  [default]
```

Default move-assignment constructor.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

The documentation for this class was generated from the following files:

- include/BayesianClustering/DataProxy.hpp
- src/BayesianClustering/DataProxy.cpp

4.6 GSLInterpolator Class Reference

A utility wrapper around the GSL interpolator to give it a clean C++ interface.

```
#include <GSLInterpolator.hpp>
```

Public Member Functions

- GSLInterpolator (const gsl_interp_type ∗type, const unsigned int &ndata)

  Empty splice constructor.
- GSLInterpolator (const gsl_interp_type ∗type, const std::vector< double > &x, const std::vector< double > &y)

  Initialised splice constructor.
- virtual ∼GSLInterpolator ()

  Destructor.
- GSLInterpolator (const GSLInterpolator &aOther)=delete

  Deleted copy constructor.
- GSLInterpolator & operator= (const GSLInterpolator &aOther)=delete

  Deleted assignment operator.
- GSLInterpolator (GSLInterpolator &&aOther)=default

Default move constructor.

- GSLInterpolator & operator= (GSLInterpolator &&aOther)=default

  Default move-assignment constructor.

- bool SetData (const std::vector< double > &x, const std::vector< double > &y)

  Set the spline data points.

- bool SetData (const unsigned int &ndata, const double ∗x, const double ∗y)

  Set the spline data points.

- double Evaluate (const std::function< int(double &) > &aFunction, const std::string &aName)

  Utility function that runs the GSL function that has been wrapped in a lambda below.

- double Eval (const double &x)

  Evaluate the spline at the given x.

- double Deriv (const double &x)

  The first derivative of the spline at the given x.

- double Deriv2 (const double &x)

  The second derivative of the spline at the given x.

- double Integ (const double &a, const double &b)

  The integral over the spline between two bounds.

Private Attributes

- unsigned int nErrors

  An error counter to suppress excess messages.

- gsl_interp_accel ∗ fAccel

  Underlying GSL machinery.

- gsl_spline ∗ fSpline

  Underlying GSL machinery for the spline itself.

- const gsl_interp_type ∗ fInterpType

  Underlying GSL machinery for the interpolation type.

4.6.1 Detailed Description

A utility wrapper around the GSL interpolator to give it a clean C++ interface.

Definition at line 19 of file GSLInterpolator.hpp.

4.6.2 Constructor & Destructor Documentation

4.6.2.1 GSLInterpolator() [1/4]

```
GSLInterpolator::GSLInterpolator (
          const gsl_interp_type * type,
          const unsigned int & ndata )
```

Empty splice constructor.

Parameters

type	The spline type
ndata	The number of points that will be added to the spline

Definition at line 9 of file GSLInterpolator.cpp.

References fInterpType, and fSpline.

4.6.2.2 GSLInterpolator() [2/4]

```
GSLInterpolator::GSLInterpolator (
            const gsl_interp_type * type,
            const std::vector< double > & x,
            const std::vector< double > & y )
```

Initialised splice constructor.

Parameters

type	The spline type
x	The points on the x-axis
y	The points on the y-axis

Definition at line 19 of file GSLInterpolator.cpp.

References fInterpType, fSpline, and SetData().

4.6.2.3 GSLInterpolator() [3/4]

```
GSLInterpolator::GSLInterpolator (
            const GSLInterpolator & aOther )  [delete]
```

Deleted copy constructor.

Parameters

aOther	Anonymous argument

4.6.2.4 GSLInterpolator() [4/4]

```
GSLInterpolator::GSLInterpolator (
            GSLInterpolator && aOther )  [default]
```

Default move constructor.

Parameters

aOther	Anonymous argument

4.6.3 Member Function Documentation

4.6.3.1 Deriv()

```
double GSLInterpolator::Deriv (
            const double & x )  [inline]
```

The first derivative of the spline at the given x.

Parameters

x	The x-coordinate at which to evaluate the derivative

Returns

> The first derivative of the spline at the given x-coordinate

Definition at line 104 of file GSLInterpolator.hpp.

References Evaluate(), fAccel, and fSpline.

4.6.3.2 Deriv2()

```
double GSLInterpolator::Deriv2 (
            const double & x )  [inline]
```

The second derivative of the spline at the given x.

Parameters

x	The x-coordinate at which to evaluate the derivative

Returns

> The second derivative of the spline at the given x-coordinate

Definition at line 114 of file GSLInterpolator.hpp.

References Evaluate(), fAccel, and fSpline.

4.6.3.3 Eval()

```
double GSLInterpolator::Eval (
            const double & x )  [inline]
```

Evaluate the spline at the given x.

Parameters

x	The x-coordinate at which to evaluate the spline

Returns

The value of the spline at the given x-coordinate

Definition at line 94 of file GSLInterpolator.hpp.

References Evaluate(), fAccel, and fSpline.

Referenced by ScanConfiguration::FromVector().

4.6.3.4 Evaluate()

```
double GSLInterpolator::Evaluate (
            const std::function< int(double &) > & aFunction,
            const std::string & aName )  [inline]
```

Utility function that runs the GSL function that has been wrapped in a lambda below.

Parameters

aFunction	A lambda that will be evaluated
aName	The operation name for the debugging messages

Returns

The interpolated value

Definition at line 75 of file GSLInterpolator.hpp.

References fAccel, and nErrors.

Referenced by Deriv(), Deriv2(), Eval(), and Integ().

4.6.3.5 Integ()

```
double GSLInterpolator::Integ (
            const double & a,
            const double & b )  [inline]
```

The integral over the spline between two bounds.

Parameters

a	The lower bound of the integral
b	The upper bound of the integral

Returns

> The integral over the spline between a and b

Definition at line 125 of file GSLInterpolator.hpp.

References Evaluate(), fAccel, and fSpline.

4.6.3.6 operator=() [1/2]

```
GSLInterpolator& GSLInterpolator::operator= (
            const GSLInterpolator & aOther )  [delete]
```

Deleted assignment operator.

Returns

> Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.6.3.7 operator=() [2/2]

```
GSLInterpolator& GSLInterpolator::operator= (
            GSLInterpolator && aOther )  [default]
```

Default move-assignment constructor.

Returns

> Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.6.3.8 SetData() [1/2]

```
bool GSLInterpolator::SetData (
            const std::vector< double > & x,
            const std::vector< double > & y )  [inline]
```

Set the spline data points.

Parameters

x	The x-coordinates of the datapoints
y	The y-coordinates of the datapoints

Returns

success or fail

Definition at line 58 of file GSLInterpolator.hpp.

Referenced by GSLInterpolator().

4.6.3.9 SetData() [2/2]

```
bool GSLInterpolator::SetData (
            const unsigned int & ndata,
            const double * x,
            const double * y )
```

Set the spline data points.

Parameters

ndata	The number of data points
x	Pointer to the first element of an array of x-coordinates
y	Pointer to the first element of an array of y-coordinates

Returns

success or fail

Definition at line 38 of file GSLInterpolator.cpp.

References fAccel, fInterpType, fSpline, and nErrors.

The documentation for this class was generated from the following files:

- include/Utilities/GSLInterpolator.hpp
- src/Utilities/GSLInterpolator.cpp

4.7 LocalizationFile Class Reference

A class to store the raw data-points.

```
#include <LocalizationFile.hpp>
```

Public Member Functions

- LocalizationFile (const std::string &aFilename)

    Constructor.
- LocalizationFile (const LocalizationFile &aOther)=delete

    Deleted copy constructor.
- LocalizationFile & operator= (const LocalizationFile &aOther)=delete

    Deleted assignment operator.
- LocalizationFile (LocalizationFile &&aOther)=default

    Default move constructor.
- LocalizationFile & operator= (LocalizationFile &&aOther)=default

    Default move-assignment constructor.
- ∼LocalizationFile ()=default

    Default destructor.
- void ExtractRoIs (const std::function< void(RoI &) > &aCallback) const

    Automatically extract the RoIs.
- void ExtractRoIs (const ManualRoI &aRoI, const std::function< void(RoI &) > &aCallback) const

    Manually extract an RoI.

Private Attributes

- std::vector< Data > mData

    The localizations in the file.

4.7.1 Detailed Description

A class to store the raw data-points.

Definition at line 25 of file LocalizationFile.hpp.

4.7.2 Constructor & Destructor Documentation

4.7.2.1 LocalizationFile() [1/3]

```
LocalizationFile::LocalizationFile (
            const std::string & aFilename )
```

Constructor.

Parameters

aFilename	The name of the localizations file

Definition at line 68 of file LocalizationFile.cpp.

References __LoadCSV__(), mData, Nthreads, and range().

4.7.2.2 LocalizationFile() [2/3]

```
LocalizationFile::LocalizationFile (
            const LocalizationFile & aOther )  [delete]
```

Deleted copy constructor.

Parameters

aOther	Anonymous argument

4.7.2.3 LocalizationFile() [3/3]

```
LocalizationFile::LocalizationFile (
            LocalizationFile && aOther )  [default]
```

Default move constructor.

Parameters

aOther	Anonymous argument

4.7.3 Member Function Documentation

4.7.3.1 ExtractRoIs() [1/2]

```
void LocalizationFile::ExtractRoIs (
            const ManualRoI & aRoI,
            const std::function< void(RoI &) > & aCallback ) const
```

Manually extract an RoI.

Parameters

aRoI	The manual RoI window
aCallback	A handler for each RoI found

Definition at line 268 of file LocalizationFile.cpp.

References ManualRoI::height, mData, RoI::SetCentre(), RoI::SetWidth(), ManualRoI::width, ManualRoI::x, and ManualRoI::y.

4.7.3.2   ExtractRoIs() [2/2]

```
void LocalizationFile::ExtractRoIs (
            const std::function< void(RoI &) > & aCallback ) const
```

Automatically extract the RoIs.

Parameters

aCallback	A handler for each RoI found

Definition at line 119 of file LocalizationFile.cpp.

References __RecursiveSearch__(), mData, RoI::SetCentre(), and RoI::SetWidth().

Referenced by AutoRoi_Cluster_FullCallback(), AutoRoi_Scan_FullCallback(), AutoRoi_Scan_SimpleCallback(), ManualRoi_Cluster_FullCallback(), ManualRoi_Scan_FullCallback(), and ManualRoi_Scan_SimpleCallback().

4.7.3.3   operator=() [1/2]

```
LocalizationFile& LocalizationFile::operator= (
            const LocalizationFile & aOther )  [delete]
```

Deleted assignment operator.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.7.3.4 operator=() **[2/2]**

LocalizationFile& LocalizationFile::operator= (
            LocalizationFile && *aOther*) [default]

Default move-assignment constructor.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

The documentation for this class was generated from the following files:

- include/BayesianClustering/LocalizationFile.hpp
- src/BayesianClustering/LocalizationFile.cpp

4.8 ManualRoI Struct Reference

A struct for storing the manual RoIs.

```
#include <LocalizationFile.hpp>
```

Public Attributes

- double x

    The x-centre of the RoI.
- double y

    The y-centre of the RoI.
- double width

    The width of the RoI.
- double height

    The height of the RoI.

4.8.1 Detailed Description

A struct for storing the manual RoIs.

Definition at line 15 of file LocalizationFile.hpp.

The documentation for this struct was generated from the following file:

- include/BayesianClustering/LocalizationFile.hpp

4.9 Cluster::Parameter Struct Reference

A struct representing the cluster parameters.

```
#include <Cluster.hpp>
```

Public Member Functions

- Parameter ()

  Default constructor.
- Parameter & operator+= (const Parameter &aOther)

  Add another set of parameters to this set.
- double log_score () const

  Convert the parameters to a log-probability.
- double alt_log_score () const

  Sean's alternative function to calculate the log-score using only the A's and B's as per the original paper for debugging.

Public Attributes

- PRECISION A

  Parameter A defined in the math.
- PRECISION Bx

  Parameter Bx defined in the math.
- PRECISION By

  Parameter By defined in the math.
- PRECISION C

  Parameter C defined in the math.
- PRECISION logF

  Parameter logF defined in the math.
- PRECISION weightedCentreX

  Parameters added by Sean for validation.
- PRECISION weightedCentreY

  Parameters added by Sean for validation.
- PRECISION S2

  Parameters added by Sean for validation.

4.9.1 Detailed Description

A struct representing the cluster parameters.

Definition at line 21 of file Cluster.hpp.

4.9.2 Member Function Documentation

4.9.2.1 alt_log_score()

```
double Cluster::Parameter::alt_log_score ( ) const
```

Sean's alternative function to calculate the log-score using only the A's and B's as per the original paper for debugging.

Returns

the log-probability of this set of cluster parameters

Definition at line 47 of file Cluster.cpp.

References normal_cdf().

4.9.2.2 log_score()

```
double Cluster::Parameter::log_score ( ) const
```

Convert the parameters to a log-probability.

Returns

the log-probability of this set of cluster parameters

Definition at line 72 of file Cluster.cpp.

References normal_cdf().

4.9.2.3 operator+=()

```
Cluster::Parameter & Cluster::Parameter::operator+= (
            const Parameter & aOther )
```

Add another set of parameters to this set.

Parameters

aOther	Another set of parameters to add to this set

Returns

Reference to this, for chaining calls

Definition at line 37 of file Cluster.cpp.

References A, Bx, By, C, and logF.

The documentation for this struct was generated from the following files:

- include/BayesianClustering/Cluster.hpp
- src/BayesianClustering/Cluster.cpp

4.10 ProgressBar Class Reference

A utility progress-bar.

```
#include <ProgressBar.hpp>
```

Public Member Functions

- ProgressBar (const std::string &aLabel, const uint32_t &aMax)

    Constructor.
- virtual ∼ProgressBar ()

    Destructor.
- void operator++ ()

    Postfix increment.
- void operator++ (int aDummy)

    Prefix increment.

Private Member Functions

- void print ()

    Update the screen.

Private Attributes

- float mBlockSize

    The size of each increment.
- float mNextThreshold

    The next threshold at which we will write a block to stdout.
- std::size_t mCount

    The number of times we have incremented.
- std::chrono::high_resolution_clock::time_point mStart

    A timer for end-of-task stats.
- std::mutex mMutex

    A mutex for multi-threaded updates.
- std::string mLabel

    The label for the start of the line.
- std::size_t mPercent

    The current progress.

4.10.1 Detailed Description

A utility progress-bar.

Definition at line 8 of file ProgressBar.hpp.

4.10.2 Constructor & Destructor Documentation

4.10.2.1 ProgressBar()

```
ProgressBar::ProgressBar (
            const std::string & aLabel,
            const uint32_t & aMax )
```

Constructor.

Parameters

aLabel	A description of the task being timed
aMax	The number of calls equalling 100%

Definition at line 8 of file ProgressBar.cpp.

References mLabel, and print().

4.10.3 Member Function Documentation

4.10.3.1 operator++()

```
void ProgressBar::operator++ (
            int aDummy )
```

Prefix increment.

Parameters

aDummy	Anonymous argument

Definition at line 39 of file ProgressBar.cpp.

References operator++().

The documentation for this class was generated from the following files:

- include/Utilities/ProgressBar.hpp
- src/Utilities/ProgressBar.cpp

4.11 ProgressTimer Struct Reference

A utility code timer.

```
#include <ProgressBar.hpp>
```

Public Member Functions

- ProgressTimer (const std::string &aLabel)

    Constructor.

- virtual ∼ProgressTimer ()

    Destructor.

Public Attributes

- std::chrono::high_resolution_clock::time_point mStart

    A timer for end-of-task stats.

4.11.1 Detailed Description

A utility code timer.

Definition at line 49 of file ProgressBar.hpp.

4.11.2 Constructor & Destructor Documentation

4.11.2.1 ProgressTimer()

```
ProgressTimer::ProgressTimer (
            const std::string & aLabel )
```

Constructor.

Parameters

aLabel	A description of the task being timed

Definition at line 55 of file ProgressBar.cpp.

The documentation for this struct was generated from the following files:

- include/Utilities/ProgressBar.hpp
- src/Utilities/ProgressBar.cpp

4.12 RoI Class Reference

A class which holds the raw RoI data and global parameters.

```
#include <RoI.hpp>
```

Public Member Functions

- RoI (std::vector< Data > &&aData, const std::size_t &aId=0)

  Default Constructor.
- RoI (const RoI &aOther)=delete

  Deleted copy constructor.
- RoI & operator= (const RoI &aOther)=delete

  Deleted assignment operator.
- RoI (RoI &&aOther)=default

  Default move constructor.
- ∼RoI ()

  Default destructor.
- RoI & operator= (RoI &&aOther)=default

  Default move-assignment constructor.
- void Preprocess (const double &aMaxR, const std::vector< double > &aSigmabins2)

  All the necessary pre-processing to get the RoI ready for an RT-scan.
- void ScanRT (const ScanConfiguration &aScanConfig, const std::function< void(RoIproxy &, const double &, const double &) > &aCallback)

  Run the scan.
- void Clusterize (const double &R, const double &T, const std::function< void(RoIproxy &) > &aCallback)

  Run clusterization for a specific choice of R and T.
- void SetCentre (const double &aPhysicalCentreX, const double &aPhysicalCentreY)

  Setter for the centre of the scan window.
- void SetWidth (const double &aWidthX, const double &aWidthY)

  Setter for the size of the RoI window.
- double getCentreX () const

  Getter for the x-coordinate of the physical centre.
- double getCentreY () const

  Getter for the y-coordinate of the physical centre.
- double getWidthX () const

  Getter for the width of the ROI window.
- double getWidthY () const

  Getter for the height of the ROI window.
- double getArea () const

  Getter for the height of the ROI window.

Public Attributes

- std::size_t mId

    A unique identifier.
- std::vector< Data > mData

    The collection of raw data points.

Private Attributes

- double mPhysicalCentreX

    The x-coordinate of the centre of the window in physical units.
- double mPhysicalCentreY

    The y-coordinate of the centre of the window in physical units.
- double mWidthX

    The width of the window in the x-direction in physical units.
- double mWidthY

    The width of the window in the y-direction in physical units.
- double mArea

    The area of the window in physical units.

4.12.1 Detailed Description

A class which holds the raw RoI data and global parameters.

Definition at line 17 of file RoI.hpp.

4.12.2 Constructor & Destructor Documentation

4.12.2.1 RoI() [1/3]

```
RoI::RoI (
            std::vector< Data > && aData,
            const std::size_t & aId = 0 )
```

Default Constructor.

Parameters

aData	The set of data-points in the RoI
aId	A unique identifier

Definition at line 17 of file RoI.cpp.

References mData.

4.12.2.2 RoI() [2/3]

```
RoI::RoI (
            const RoI & aOther ) [delete]
```

Deleted copy constructor.

Parameters

aOther	Anonymous argument

4.12.2.3 RoI() [3/3]

```
RoI::RoI (
            RoI && aOther ) [default]
```

Default move constructor.

Parameters

aOther	Anonymous argument

4.12.3 Member Function Documentation

4.12.3.1 Clusterize()

```
void RoI::Clusterize (
            const double & R,
            const double & T,
            const std::function< void(RoIproxy &) > & aCallback )
```

Run clusterization for a specific choice of R and T.

Parameters

R	The R parameter for clusterization
T	The T parameter for clusterization
aCallback	A callback for the clusterization results

Definition at line 58 of file RoI.cpp.

References RoIproxy::Clusterize(), and Preprocess().

Referenced by AutoRoi_Cluster_FullCallback(), and ManualRoi_Cluster_FullCallback().

4.12.3.2 getArea()

```
double RoI::getArea ( ) const  [inline]
```

Getter for the height of the ROI window.

Returns

> The height of the ROI window

Definition at line 102 of file RoI.hpp.

References mArea.

Referenced by RoIproxy::Clusterize(), and ScanRT().

4.12.3.3 getCentreX()

```
double RoI::getCentreX ( ) const  [inline]
```

Getter for the x-coordinate of the physical centre.

Returns

> The x-coordinate of the physical centre

Definition at line 75 of file RoI.hpp.

References mPhysicalCentreX.

4.12.3.4 getCentreY()

```
double RoI::getCentreY ( ) const  [inline]
```

Getter for the y-coordinate of the physical centre.

Returns

> The y-coordinate of the physical centre

Definition at line 81 of file RoI.hpp.

References mPhysicalCentreY.

4.12.3.5 getWidthX()

```
double RoI::getWidthX ( ) const  [inline]
```

Getter for the width of the ROI window.

Returns

The width of the ROI window

Definition at line 88 of file RoI.hpp.

References mWidthX.

4.12.3.6 getWidthY()

```
double RoI::getWidthY ( ) const  [inline]
```

Getter for the height of the ROI window.

Returns

The height of the ROI window

Definition at line 95 of file RoI.hpp.

References mWidthY.

4.12.3.7 operator=() [1/2]

```
RoI& RoI::operator= (
            const RoI & aOther )  [delete]
```

Deleted assignment operator.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.12.3.8 operator=() [2/2]

```
RoI& RoI::operator= (
            RoI && aOther ) [default]
```

Default move-assignment constructor.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.12.3.9 Preprocess()

```
void RoI::Preprocess (
            const double & aMaxR,
            const std::vector< double > & aSigmabins2 )
```

All the necessary pre-processing to get the RoI ready for an RT-scan.

Parameters

aMaxR	The maximum radius out to which we should pre-process
aSigmabins2	The number of sigma bins

Definition at line 35 of file RoI.cpp.

References mData, and range().

Referenced by Clusterize(), and ScanRT().

4.12.3.10 ScanRT()

```
void RoI::ScanRT (
            const ScanConfiguration & aScanConfig,
            const std::function< void(RoIproxy &, const double &, const double &) > & a↩
Callback )
```

Run the scan.

Parameters

aScanConfig	The configuration parameters for the scan
aCallback	A callback for each RT-scan result

Definition at line 44 of file RoI.cpp.

References ScanConfiguration::tBounds::bins, getArea(), mData, Nthreads, Preprocess(), range(), Scan↩
Configuration::Rbounds(), ScanConfiguration::sigmabins2(), and ScanConfiguration::Tbounds().

Referenced by _FullScanToSimpleScan_(), AutoRoi_Scan_FullCallback(), and ManualRoi_Scan_FullCallback().

4.12.3.11 SetCentre()

```
void RoI::SetCentre (
            const double & aPhysicalCentreX,
            const double & aPhysicalCentreY )
```

Setter for the centre of the scan window.

Parameters

aPhysicalCentreX	The x-coordinate of the centre of the window in physical units (becomes 0 in algorithm units)
aPhysicalCentreY	The y-coordinate of the centre of the window in physical units (becomes 0 in algorithm units)

Definition at line 70 of file RoI.cpp.

References mPhysicalCentreX, and mPhysicalCentreY.

Referenced by LocalizationFile::ExtractRoIs().

4.12.3.12 SetWidth()

```
void RoI::SetWidth (
            const double & aWidthX,
            const double & aWidthY )
```

Setter for the size of the RoI window.

Parameters

aWidthX	The width of the window in physical units
aWidthY	The height of the window in physical units

Definition at line 77 of file RoI.cpp.

References mArea, mWidthX, and mWidthY.

Referenced by LocalizationFile::ExtractRoIs().

The documentation for this class was generated from the following files:

- include/BayesianClustering/RoI.hpp
- src/BayesianClustering/RoI.cpp

4.13   RoIproxy Class Reference

A lightweight wrapper for the RoI to store clusters for a given scan.

```
#include <RoIproxy.hpp>
```

Collaboration diagram for RoIproxy:
Public Member Functions

- RoIproxy (RoI &aRoI)

    Default constructor.
- RoIproxy (const RoIproxy &aOther)=delete

    Deleted copy constructor.
- RoIproxy & operator= (const RoIproxy &aOther)=delete

    Deleted assignment operator.
- RoIproxy (RoIproxy &&aOther)=default

    Default move constructor.
- RoIproxy & operator= (RoIproxy &&aOther)=default

    Default move-assignment constructor.
- ∼RoIproxy ()

    Default destructor.
- void CheckClusterization (const double &R, const double &T)

    Run validation tests on the clusters.
- void ScanRT (const ScanConfiguration &aScanConfig, const std::function< void(RoIproxy &, const double &, const double &) > &aCallback, ProgressBar &aProgressBar, const uint8_t &aParallelization=1, const uint8_t &aOffset=0, const bool &aValidate=false)

    Run an RT-scan.
- void Clusterize (const double &R, const double &T, const std::function< void(RoIproxy &) > &aCallback)

    Run clusterization for a specific choice of R and T.
- void UpdateLogScore (const ScanConfiguration &aScanConfig)

    Update log-probability after a scan.
- void ValidateLogScore (const ScanConfiguration &aScanConfig)

    Sean's validation code for testing when the running log-score fails.
- DataProxy & GetData (const std::size_t &aIndex)

    Get the proxy for the Nth neighbour of this data-point.

Public Attributes

- std::vector< DataProxy > mData

  The collection of lightweight data-point wrappers used by this RoI wrapper.
- std::vector< Cluster > mClusters

  The collection of clusters found by this scan.
- std::size_t mClusteredCount

  The number of clustered data-points.
- std::size_t mBackgroundCount

  The number of background data-points.
- std::size_t mClusterCount

  The number of non-Null clusters.
- double mLogP

  The log-probability density associated with the last scan.
- const RoI & mRoI

  The underlying RoI this is a proxy to.

4.13.1 Detailed Description

A lightweight wrapper for the RoI to store clusters for a given scan.

Definition at line 19 of file RoIproxy.hpp.

4.13.2 Constructor & Destructor Documentation

4.13.2.1 RoIproxy() [1/3]

```
RoIproxy::RoIproxy (
            RoI & aRoI )
```

Default constructor.

Parameters

aRoI	An RoI for which this is a lightweight proxy

Definition at line 17 of file RoIproxy.cpp.

References mClusters, RoI::mData, and mData.

4.13.2.2 RoIproxy() [2/3]

```
RoIproxy::RoIproxy (
            const RoIproxy & aOther )  [delete]
```

Deleted copy constructor.

Parameters

aOther	Anonymous argument

4.13.2.3 RoIproxy() [3/3]

```
RoIproxy::RoIproxy (
            RoIproxy && aOther )  [default]
```

Default move constructor.

Parameters

aOther	Anonymous argument

4.13.3 Member Function Documentation

4.13.3.1 CheckClusterization()

```
void RoIproxy::CheckClusterization (
            const double & R,
            const double & T )
```

Run validation tests on the clusters.

Parameters

R	The R of the last run scan
T	The T of the last run scan

Definition at line 34 of file RoIproxy.cpp.

References GetData(), mBackgroundCount, mClusterCount, mClusters, and mData.

4.13.3.2 Clusterize()

```
void RoIproxy::Clusterize (
            const double & R,
            const double & T,
            const std::function< void(RoIproxy &) > & aCallback )
```

Run clusterization for a specific choice of R and T.

Parameters

R	The R parameter for clusterization
T	The T parameter for clusterization
aCallback	A callback for the clusterization results

Definition at line 139 of file RoIproxy.cpp.

References RoI::getArea(), mClusters, RoI::mData, mData, and mRoI.

Referenced by RoI::Clusterize().

4.13.3.3 GetData()

```
DataProxy& RoIproxy::GetData (
            const std::size_t & aIndex )  [inline]
```

Get the proxy for the Nth neighbour of this data-point.

Returns

A reference to the neighbour data-proxy

Parameters

aIndex	The index of the neighbour we are looking for

Definition at line 74 of file RoIproxy.hpp.

References mData.

Referenced by CheckClusterization(), and DataProxy::Clusterize().

4.13.3.4 operator=() [1/2]

```
RoIproxy& RoIproxy::operator= (
            const RoIproxy & aOther )  [delete]
```

Deleted assignment operator.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.13.3.5 operator=() [2/2]

[RoIproxy](#)& RoIproxy::operator= (
            [RoIproxy](#) && *aOther*) [default]

Default move-assignment constructor.

Returns

>   Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.13.3.6 ScanRT()

```
void RoIproxy::ScanRT (
            const ScanConfiguration & aScanConfig,
            const std::function< void(RoIproxy &, const double &, const double &) > & a←
Callback,
            ProgressBar & aProgressBar,
            const uint8_t & aParallelization = 1,
            const uint8_t & aOffset = 0,
            const bool & aValidate = false )
```

Run an RT-scan.

Parameters

aScanConfig	The configuration parameters for the scan
aCallback	A callback for each RT-scan result
aProgressBar	The progress bar to update
aParallelization	The stride with which we will iterate across RT parameters
aOffset	The starting point for the strides as we iterate across RT parameters
aValidate	Run validation of the score calculation

Definition at line 104 of file RoIproxy.cpp.

4.13.3.7 UpdateLogScore()

```
void RoIproxy::UpdateLogScore (
            const ScanConfiguration & aScanConfig )
```

Update log-probability after a scan.

Parameters

aScanConfig	The configuration parameters for the scan

Definition at line 219 of file RoIproxy.cpp.

References ScanConfiguration::alpha(), ScanConfiguration::logAlpha(), ScanConfiguration::logGammaAlpha(), ScanConfiguration::logPb(), ScanConfiguration::logPbDagger(), mBackgroundCount, mClusterCount, m↩
ClusteredCount, mClusters, mData, mLogP, and ScanConfiguration::sigmabins().

4.13.3.8 ValidateLogScore()

```
void RoIproxy::ValidateLogScore (
            const ScanConfiguration & aScanConfig )
```

Sean's validation code for testing when the running log-score fails.

Parameters

aScanConfig	The configuration parameters for the scan

Definition at line 160 of file RoIproxy.cpp.

References mClusters, mData, Cluster::mParams, Data::s, ScanConfiguration::sigmabins2(), ScanConfiguration↩
::sigmacount(), Data::x, and Data::y.

The documentation for this class was generated from the following files:

- include/BayesianClustering/RoIproxy.hpp
- src/BayesianClustering/RoIproxy.cpp

4.14 ScanConfiguration Class Reference

Class for storing the scan configuration parameters.

```
#include <Configuration.hpp>
```

Collaboration diagram for ScanConfiguration:

Classes

- struct tBounds

    A struct to store the bounds of a scan in either R or T.

Public Member Functions

- ScanConfiguration (const std::string &aCfgFile)

    Constructor which parses the parameters when passed in as commandline arguments.

- ScanConfiguration (const std::size_t &aSigmacount, const double &aSigmaMin, const double &aSigmaMax, const std::function< double(const double &) > &aInterpolator, const std::size_t &aRbins, const double &a↩ MinScanR, const double &aMaxScanR, const std::size_t &aTbins, const double &aMinScanT, const double &aMaxScanT, const double &aPB, const double &aAlpha)

    Constructor which take the parameters directly.

- ScanConfiguration (const ScanConfiguration &aOther)=delete

    Deleted copy constructor.

- ScanConfiguration & operator= (const ScanConfiguration &aOther)=delete

    Deleted assignment operator.

- ScanConfiguration (ScanConfiguration &&aOther)=default

    Default move constructor.

- ScanConfiguration & operator= (ScanConfiguration &&aOther)=default

    Default move-assignment constructor.

- ∼ScanConfiguration ()=default

    Default destructor.

- void SetSigmaParameters (const std::size_t &aSigmacount, const double &aSigmaMin, const double &a↩ SigmaMax, const std::function< double(const double &) > &aInterpolator)

    Setter for the sigma-bins to be integrated over.

- void SetRBins (const std::size_t &aRbins, const double &aMinScanR, const double &aMaxScanR)

    Setter for the R bins for the RT scan.

- void SetTBins (const std::size_t &aTbins, const double &aMinScanT, const double &aMaxScanT)

- void SetPb (const double &aPB)

    Setter for the P_b parameter.

- void SetAlpha (const double &aAlpha)

    Setter for the alpha parameter.
- const std::size_t & sigmacount () const

    Getter for the sigma count.
- const double & sigmaspacing () const

    Getter for the sigma spacing.
- const std::vector< double > & sigmabins () const

    Getter for the values of sigma.
- const std::vector< double > & sigmabins2 () const

    Getter for the values of sigma squared.
- const std::vector< double > & probability_sigma () const

    Getter for the probabilities of a given sigma.
- const std::vector< double > & log_probability_sigma () const

    Getter for the log of the probabilities of a given sigma.
- const double & sigmabins (const std::size_t &i) const

    Getter for the i'th value of sigma.
- const double & sigmabins2 (const std::size_t &i) const

    Getter for the i'th value of sigma squared.
- const double & probability_sigma (const std::size_t &i) const

    Getter for the probability of the i'th value of sigma.
- const double & log_probability_sigma (const std::size_t &i) const

    Getter for the log-probability of the i'th value of sigma.
- const tBounds & Rbounds () const

    Getter for the bounds of R to scan.
- const tBounds & Tbounds () const

    Getter for the bounds of T to scan.
- const double & logPb () const

    Logarithm of the P_b parameter.
- const double & logPbDagger () const

    Logarithm of the (1 - P_b) parameter.
- const double & alpha () const

    Getter for the alpha parameter.
- const double & logAlpha () const

    Getter for the logarithm of the alpha parameter.
- const double & logGammaAlpha () const

    Getter for the logarithm of the gamma function of alpha parameter.

Private Member Functions

- void FromVector (const std::vector< std::string > &aArgs)

    Parse the parameters when passed in as commandline arguments.

Private Attributes

- std::size_t mSigmacount

  The number of sigma bins.
- double mSigmaspacing

  The spacing of sigma bins.
- std::vector< double > mSigmabins

  The values of sigma.
- std::vector< double > mSigmabins2

  The values of sigma squared.
- std::vector< double > mProbabilitySigma

  The probability of a given sigma.
- std::vector< double > mLogProbabilitySigma

  The log-probability of a gievn sigma.
- tBounds mRbounds

  The bounds of R to scan.
- tBounds mTbounds

  The bounds of T to scan.
- double mAlpha

  The alpha parameter.
- double mLogAlpha

  Logarithm of the alpha parameter.
- double mLogGammaAlpha

  Logarithm of the gamma function of alpha parameter.
- double mLogPb

  Logarithm of the P_b parameter.
- double mLogPbDagger

  Logarithm of the(1- P_b) parameter.

4.14.1 Detailed Description

Class for storing the scan configuration parameters.

Definition at line 11 of file Configuration.hpp.

4.14.2 Constructor & Destructor Documentation

4.14.2.1 ScanConfiguration() [1/4]

```
ScanConfiguration::ScanConfiguration (
            const std::string & aCfgFile )
```

Constructor which parses the parameters when passed in as commandline arguments.

Parameters

aCfgFile	A Scan-parameter config file name

Definition at line 41 of file Configuration.cpp.

References FromVector().

4.14.2.2 ScanConfiguration() [2/4]

```
ScanConfiguration::ScanConfiguration (
            const std::size_t & aSigmacount,
            const double & aSigmaMin,
            const double & aSigmaMax,
            const std::function< double(const double &) > & aInterpolator,
            const std::size_t & aRbins,
            const double & aMinScanR,
            const double & aMaxScanR,
            const std::size_t & aTbins,
            const double & aMinScanT,
            const double & aMaxScanT,
            const double & aPB,
            const double & aAlpha )
```

Constructor which take the parameters directly.

Parameters

aSigmacount	The number of sigma bins
aSigmaMin	The lowest sigma bin
aSigmaMax	The highest sigma bin
aInterpolator	Function-object to generate the probability of any given sigma
aRbins	The number of R bins to scan over
aMinScanR	The lowest value of R to scan
aMaxScanR	The largest value of R to scan
aTbins	The number of T bins to scan over
aMinScanT	The lowest value of T to scan
aMaxScanT	The largest value of T to scan
aPB	The P_b parameter
aAlpha	The alpha parameter

Definition at line 55 of file Configuration.cpp.

References SetAlpha(), SetPb(), SetRBins(), SetSigmaParameters(), and SetTBins().

4.14.2.3 ScanConfiguration() [3/4]

```
ScanConfiguration::ScanConfiguration (
            const ScanConfiguration & aOther ) [delete]
```

Deleted copy constructor.

Parameters

aOther	Anonymous argument

4.14.2.4 ScanConfiguration() [4/4]

```
ScanConfiguration::ScanConfiguration (
            ScanConfiguration && aOther ) [default]
```

Default move constructor.

Parameters

aOther	Anonymous argument

4.14.3 Member Function Documentation

4.14.3.1 alpha()

```
const double& ScanConfiguration::alpha ( ) const  [inline]
```

Getter for the alpha parameter.

Returns

The alpha parameter

Definition at line 211 of file Configuration.hpp.

References mAlpha.

Referenced by RoIproxy::UpdateLogScore().

4.14.3.2 FromVector()

```
void ScanConfiguration::FromVector (
            const std::vector< std::string > & aArgs )  [private]
```

Parse the parameters when passed in as commandline arguments.

Parameters

aArgs	The commandline arguments

Definition at line 162 of file Configuration.cpp.

References GSLInterpolator::Eval(), SetAlpha(), SetPb(), SetRBins(), SetSigmaParameters(), SetTBins(), and Str↵
ToDist().

Referenced by ScanConfiguration().

4.14.3.3 log_probability_sigma() [1/2]

```
const std::vector< double >& ScanConfiguration::log_probability_sigma ( ) const  [inline]
```

Getter for the log of the probabilities of a given sigma.

Returns

> The log of the probabilities of given sigma

Definition at line 149 of file Configuration.hpp.

References mLogProbabilitySigma.

Referenced by Cluster::UpdateLogScore().

4.14.3.4 log_probability_sigma() [2/2]

```
const double& ScanConfiguration::log_probability_sigma (
            const std::size_t & i ) const  [inline]
```

Getter for the log-probability of the i'th value of sigma.

Parameters

i	The index of the value of sigma to get the log-probability for

Returns

> The log-probability of sigma_i

Definition at line 178 of file Configuration.hpp.

References mLogProbabilitySigma.

4.14.3.5 logAlpha()

```
const double& ScanConfiguration::logAlpha ( ) const  [inline]
```

Getter for the logarithm of the alpha parameter.

Returns

> The logarithm of the alpha parameter

Definition at line 217 of file Configuration.hpp.

References mLogAlpha.

Referenced by RoIproxy::UpdateLogScore().

4.14.3.6 logGammaAlpha()

```
const double& ScanConfiguration::logGammaAlpha ( ) const  [inline]
```

Getter for the logarithm of the gamma function of alpha parameter.

Returns

> The logarithm of the gamma function of alpha parameter

Definition at line 223 of file Configuration.hpp.

References mLogGammaAlpha.

Referenced by RoIproxy::UpdateLogScore().

4.14.3.7 logPb()

```
const double& ScanConfiguration::logPb ( ) const  [inline]
```

Logarithm of the P_b parameter.

Returns

> Logarithm of the P_b parameter

Definition at line 198 of file Configuration.hpp.

References mLogPb.

Referenced by RoIproxy::UpdateLogScore().

4.14.3.8 logPbDagger()

```
const double& ScanConfiguration::logPbDagger ( ) const   [inline]
```

Logarithm of the (1 - P_b) parameter.

Returns

Logarithm of the (1 - P_b) parameter

Definition at line 204 of file Configuration.hpp.

References mLogPbDagger.

Referenced by RoIproxy::UpdateLogScore().

4.14.3.9 operator=() [1/2]

```
ScanConfiguration& ScanConfiguration::operator= (
             const ScanConfiguration & aOther )  [delete]
```

Deleted assignment operator.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.14.3.10 operator=() [2/2]

```
ScanConfiguration& ScanConfiguration::operator= (
             ScanConfiguration && aOther )  [default]
```

Default move-assignment constructor.

Returns

Reference to this, for chaining calls

Parameters

aOther	Anonymous argument

4.14.3.11 probability_sigma() [1/2]

```
const std::vector< double >& ScanConfiguration::probability_sigma ( ) const  [inline]
```

Getter for the probabilities of a given sigma.

Returns

The probabilities of given sigma

Definition at line 143 of file Configuration.hpp.

References mProbabilitySigma.

4.14.3.12 probability_sigma() [2/2]

```
const double& ScanConfiguration::probability_sigma (
            const std::size_t & i ) const  [inline]
```

Getter for the probability of the i'th value of sigma.

Parameters

| *i* | The index of the value of sigma to get the probability for |

Returns

The probability of sigma_i

Definition at line 171 of file Configuration.hpp.

References mProbabilitySigma.

4.14.3.13 Rbounds()

```
const tBounds& ScanConfiguration::Rbounds ( ) const  [inline]
```

Getter for the bounds of R to scan.

Returns

The lbounds of R to scan

Definition at line 185 of file Configuration.hpp.

References mRbounds.

Referenced by RoI::ScanRT().

4.14.3.14   SetAlpha()

```
void ScanConfiguration::SetAlpha (
             const double & aAlpha )
```

Setter for the alpha parameter.

Parameters

aAlpha	The alpha parameter

Definition at line 124 of file Configuration.cpp.

References mAlpha, mLogAlpha, and mLogGammaAlpha.

Referenced by FromVector(), and ScanConfiguration().

4.14.3.15   SetPb()

```
void ScanConfiguration::SetPb (
             const double & aPB )
```

Setter for the P_b parameter.

Parameters

aPB	The P_b parameter

Definition at line 117 of file Configuration.cpp.

References mLogPb, and mLogPbDagger.

Referenced by FromVector(), and ScanConfiguration().

4.14.3.16   SetRBins()

```
void ScanConfiguration::SetRBins (
             const std::size_t & aRbins,
             const double & aMinScanR,
             const double & aMaxScanR )
```

Setter for the R bins for the RT scan.

Parameters

aRbins	The number of R bins to scan over
aMinScanR	The lowest value of R to scan
aMaxScanR	The largest value of R to scan

Definition at line 97 of file Configuration.cpp.

References ScanConfiguration::tBounds::bins, ScanConfiguration::tBounds::max, ScanConfiguration::tBounds↩
::min, mRbounds, and ScanConfiguration::tBounds::spacing.

Referenced by FromVector(), and ScanConfiguration().

4.14.3.17 SetSigmaParameters()

```
void ScanConfiguration::SetSigmaParameters (
            const std::size_t & aSigmacount,
            const double & aSigmaMin,
            const double & aSigmaMax,
            const std::function< double(const double &) > & aInterpolator )
```

Setter for the sigma-bins to be integrated over.

Parameters

aSigmacount	The number of sigma bins
aSigmaMin	The lowest sigma bin
aSigmaMax	The highest sigma bin
aInterpolator	Function-object to generate the probability of any given sigma

Definition at line 69 of file Configuration.cpp.

References mLogProbabilitySigma, mProbabilitySigma, mSigmabins, mSigmabins2, mSigmacount, m↩
Sigmaspacing, and range().

Referenced by FromVector(), and ScanConfiguration().

4.14.3.18 SetTBins()

```
void ScanConfiguration::SetTBins (
            const std::size_t & aTbins,
            const double & aMinScanT,
            const double & aMaxScanT )
```

Parameters

aTbins	The number of T bins to scan over
aMinScanT	The lowest value of T to scan
aMaxScanT	The largest value of T to scan

Definition at line 107 of file Configuration.cpp.

References ScanConfiguration::tBounds::bins, ScanConfiguration::tBounds::max, ScanConfiguration::tBounds↩
::min, mTbounds, and ScanConfiguration::tBounds::spacing.

Referenced by FromVector(), and ScanConfiguration().

4.14.3.19 sigmabins() [1/2]

```
const std::vector< double >& ScanConfiguration::sigmabins ( ) const  [inline]
```

Getter for the values of sigma.

Returns

    The values of sigma

Definition at line 131 of file Configuration.hpp.

References mSigmabins.

Referenced by Cluster::UpdateLogScore(), and RoIproxy::UpdateLogScore().

4.14.3.20 sigmabins() [2/2]

```
const double& ScanConfiguration::sigmabins (
            const std::size_t & i ) const  [inline]
```

Getter for the i'th value of sigma.

Parameters

i	The index of the value of sigma to get

Returns

    The value of sigma_i

Definition at line 157 of file Configuration.hpp.

References mSigmabins.

4.14.3.21 sigmabins2() [1/2]

```
const std::vector< double >& ScanConfiguration::sigmabins2 ( ) const  [inline]
```

Getter for the values of sigma squared.

Returns

> The values of sigma squared

Definition at line 137 of file Configuration.hpp.

References mSigmabins2.

Referenced by RoI::ScanRT(), and RoIproxy::ValidateLogScore().

4.14.3.22 sigmabins2() [2/2]

```
const double& ScanConfiguration::sigmabins2 (
            const std::size_t & i ) const  [inline]
```

Getter for the i'th value of sigma squared.

Parameters

i	The index of the value of sigma squared to get

Returns

> The value of sigma_i squared

Definition at line 164 of file Configuration.hpp.

References mSigmabins2.

4.14.3.23 sigmacount()

```
const std::size_t& ScanConfiguration::sigmacount ( ) const  [inline]
```

Getter for the sigma count.

Returns

> The sigma count

Definition at line 117 of file Configuration.hpp.

References mSigmacount.

Referenced by RoIproxy::ValidateLogScore().

4.14.3.24 sigmaspacing()

```
const double& ScanConfiguration::sigmaspacing ( ) const  [inline]
```

Getter for the sigma spacing.

Returns

The sigma spacing

Definition at line 124 of file Configuration.hpp.

References mSigmaspacing.

4.14.3.25 Tbounds()

```
const tBounds& ScanConfiguration::Tbounds ( ) const  [inline]
```

Getter for the bounds of T to scan.

Returns

The lbounds of T to scan

Definition at line 191 of file Configuration.hpp.

References mTbounds.

Referenced by RoI::ScanRT().

The documentation for this class was generated from the following files:

- include/BayesianClustering/Configuration.hpp
- src/BayesianClustering/Configuration.cpp

4.15 ScanEntry Struct Reference

A struct for storing a result of an individual scan configuration.

```
#include <API.hpp>
```

Public Member Functions

- bool operator< (const ScanEntry &aOther)

    Comparison operator for sorting.
- bool operator== (const ScanEntry &aOther)

    Equality operator required by boost python.

Public Attributes

- double r

    The R parameter

- double t

    The T parameter.

- double score

    The score.

4.15.1 Detailed Description

A struct for storing a result of an individual scan configuration.

Definition at line 16 of file API.hpp.

4.15.2 Member Function Documentation

4.15.2.1 operator<()

```
bool ScanEntry::operator< (
            const ScanEntry & aOther )  [inline]
```

Comparison operator for sorting.

Returns

Whether we are smaller than the other

Parameters

aOther	Another ScanEntry to compare against

Definition at line 24 of file API.hpp.

References r, and t.

4.15.2.2 operator==()

```
bool ScanEntry::operator== (
            const ScanEntry & aOther )  [inline]
```

Equality operator required by boost python.

Returns

Whether we are equal to the other

Parameters

aOther	Another [ScanEntry](#) to compare against

Definition at line 33 of file API.hpp.

References r, score, and t.

The documentation for this struct was generated from the following file:

- include/BayesianClustering/[API.hpp](#)

4.16 ScanConfiguration::tBounds Struct Reference

A struct to store the bounds of a scan in either R or T.

```
#include <Configuration.hpp>
```

Public Attributes

- double [min](#)

  The lowest value of R to scan.
- double [max](#)

  The largest value of R to scan.
- double [spacing](#)

  The spacing of value of R to scan.
- std::size_t [bins](#)

  The number of R values to scan.

4.16.1 Detailed Description

A struct to store the bounds of a scan in either R or T.

Definition at line 16 of file Configuration.hpp.

The documentation for this struct was generated from the following file:

- include/BayesianClustering/[Configuration.hpp](#)

Chapter 5

File Documentation

5.1   include/BayesianClustering/API.hpp File Reference

```
#include <string>
#include <vector>
#include <functional>
```
Include dependency graph for API.hpp:
This graph shows which files directly or indirectly include this file:
Classes

- struct ScanEntry

  A struct for storing a result of an individual scan configuration.
- struct ClusterWrapper

  A struct for storing a result of an individual scan configuration.

Functions

- void AutoRoi_Scan_FullCallback (const std::string &aInFile, const ScanConfiguration &aScanConfig, const std::function< void(RoIproxy &, const double &, const double &) > &aCallback)

  Automatically extract RoI, run scan and apply a full call-back.
- void AutoRoi_Scan_SimpleCallback (const std::string &aInFile, const ScanConfiguration &aScanConfig, const std::function< void(const std::vector< ScanEntry > &) > &aCallback)

  Automatically extract RoI, run scan and apply a simple call-back.
- void AutoRoi_Scan_ToJson (const std::string &aInFile, const ScanConfiguration &aScanConfig, const std::string &aOutFile)

  Automatically extract RoI, run scan and dump to JSON file.
- void AutoRoi_Cluster_FullCallback (const std::string &aInFile, const double &aR, const double &aT, const std::function< void(RoIproxy &) > &aCallback)

  Automatically extract RoI, clusterize and apply a full call-back.
- void AutoRoi_Cluster_SimpleCallback (const std::string &aInFile, const double &aR, const double &aT, const std::function< void(const std::vector< ClusterWrapper > &) > &aCallback)

  Automatically extract RoI, clusterize and apply a full call-back.
- void ManualRoi_Scan_FullCallback (const std::string &aInFile, const ManualRoI &aManualRoI, const ScanConfiguration &aScanConfig, const std::function< void(RoIproxy &, const double &, const double &) > &aCallback)

  Manually extract RoI, run scan and apply a full call-back.
- void ManualRoi_Scan_SimpleCallback (const std::string &aInFile, const ManualRoI &aManualRoI, const ScanConfiguration &aScanConfig, const std::function< void(const std::vector< ScanEntry > &) > &aCallback)

  Manually extract RoI, run scan and apply a simple call-back.
- void ManualRoi_Scan_ToJson (const std::string &aInFile, const ManualRoI &aManualRoI, const ScanConfiguration &aScanConfig, const std::string &aOutFile)

  Manually extract RoI, run scan and dump to JSON file.
- void ManualRoi_Cluster_FullCallback (const std::string &aInFile, const ManualRoI &aManualRoI, const double &aR, const double &aT, const std::function< void(RoIproxy &) > &aCallback)

  Manually extract RoI, clusterize and apply a full call-back.
- void ManualRoi_Cluster_SimpleCallback (const std::string &aInFile, const ManualRoI &aManualRoI, const double &aR, const double &aT, const std::function< void(const std::vector< ClusterWrapper > &) > &aCallback)

  Manually extract RoI, clusterize and apply a full call-back.

5.1.1 Function Documentation

5.1.1.1 AutoRoi_Cluster_FullCallback()

```
void AutoRoi_Cluster_FullCallback (
            const std::string & aInFile,
            const double & aR,
            const double & aT,
            const std::function< void(RoIproxy &) > & aCallback )
```

Automatically extract RoI, clusterize and apply a full call-back.

Parameters

aInFile	The name of the localization file
aR	The R value of the clusterizer
aT	The T value of the clusterizer
aCallback	The callback to be applied

Definition at line 104 of file API.cpp.

References RoI::Clusterize(), and LocalizationFile::ExtractRoIs().

Referenced by AutoRoi_Cluster_SimpleCallback().

5.1.1.2 AutoRoi_Cluster_SimpleCallback()

```
void AutoRoi_Cluster_SimpleCallback (
            const std::string & aInFile,
            const double & aR,
            const double & aT,
            const std::function< void(const std::vector< ClusterWrapper > &) > & aCallback )
```

Automatically extract RoI, clusterize and apply a full call-back.

Parameters

aInFile	The name of the localization file
aR	The R value of the clusterizer
aT	The T value of the clusterizer
aCallback	The callback to be applied

Definition at line 110 of file API.cpp.

References _FullClusterToSimpleCluster_(), and AutoRoi_Cluster_FullCallback().

5.1.1.3 AutoRoi_Scan_FullCallback()

```
void AutoRoi_Scan_FullCallback (
            const std::string & aInFile,
            const ScanConfiguration & aScanConfig,
            const std::function< void(RoIproxy &, const double &, const double &) > & a↵
Callback )
```

Automatically extract RoI, run scan and apply a full call-back.

Parameters

aInFile	The name of the localization file
aScanConfig	The configuration for the scan
aCallback	The full callback to be applied

Definition at line 84 of file API.cpp.

References LocalizationFile::ExtractRoIs(), and RoI::ScanRT().

5.1.1.4 AutoRoi_Scan_SimpleCallback()

```
void AutoRoi_Scan_SimpleCallback (
            const std::string & aInFile,
            const ScanConfiguration & aScanConfig,
            const std::function< void(const std::vector< ScanEntry > &) > & aCallback )
```

Automatically extract RoI, run scan and apply a simple call-back.

Parameters

aInFile	The name of the localization file
aScanConfig	The configuration for the scan
aCallback	The simple callback to be applied

Definition at line 90 of file API.cpp.

References _FullScanToSimpleScan_(), and LocalizationFile::ExtractRoIs().

Referenced by AutoRoi_Scan_ToJson().

5.1.1.5 AutoRoi_Scan_ToJson()

```
void AutoRoi_Scan_ToJson (
            const std::string & aInFile,
            const ScanConfiguration & aScanConfig,
            const std::string & aOutFile )
```

Automatically extract RoI, run scan and dump to JSON file.

Parameters

| aInFile	The name of the localization file
aScanConfig	The configuration for the scan
aOutFile	The name of the output JSON file

Definition at line 96 of file API.cpp.

References _ScanCallback_Json_(), and AutoRoi_Scan_SimpleCallback().

Referenced by BOOST_PYTHON_MODULE(), and main().

5.1.1.6 ManualRoi_Cluster_FullCallback()

```
void ManualRoi_Cluster_FullCallback (
            const std::string & aInFile,
            const ManualRoI & aManualRoI,
            const double & aR,
            const double & aT,
            const std::function< void(RoIproxy &) > & aCallback )
```

Manually extract RoI, clusterize and apply a full call-back.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aR	The R value of the clusterizer
aT	The T value of the clusterizer
aCallback	The callback to be applied

Definition at line 138 of file API.cpp.

References RoI::Clusterize(), and LocalizationFile::ExtractRoIs().

Referenced by ManualRoi_Cluster_SimpleCallback().

5.1.1.7 ManualRoi_Cluster_SimpleCallback()

```
void ManualRoi_Cluster_SimpleCallback (
            const std::string & aInFile,
            const ManualRoI & aManualRoI,
            const double & aR,
            const double & aT,
            const std::function< void(const std::vector< ClusterWrapper > &) > & aCallback )
```

Manually extract RoI, clusterize and apply a full call-back.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aR	The R value of the clusterizer
aT	The T value of the clusterizer
aCallback	The callback to be applied

Definition at line 144 of file API.cpp.

References _FullClusterToSimpleCluster_(), and ManualRoi_Cluster_FullCallback().

5.1.1.8 ManualRoi_Scan_FullCallback()

```
void ManualRoi_Scan_FullCallback (
            const std::string & aInFile,
            const ManualRoI & aManualRoI,
            const ScanConfiguration & aScanConfig,
            const std::function< void(RoIproxy &, const double &, const double &) > & a↵
Callback )
```

Manually extract RoI, run scan and apply a full call-back.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aScanConfig	The configuration for the scan
aCallback	The full callback to be applied

Definition at line 118 of file API.cpp.

References LocalizationFile::ExtractRoIs(), and RoI::ScanRT().

5.1.1.9 ManualRoi_Scan_SimpleCallback()

```
void ManualRoi_Scan_SimpleCallback (
            const std::string & aInFile,
            const ManualRoI & aManualRoI,
            const ScanConfiguration & aScanConfig,
            const std::function< void(const std::vector< ScanEntry > &) > & aCallback )
```

Manually extract RoI, run scan and apply a simple call-back.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aScanConfig	The configuration for the scan
aCallback	The simple callback to be applied

Definition at line 124 of file API.cpp.

References _FullScanToSimpleScan_(), and LocalizationFile::ExtractRoIs().

Referenced by ManualRoi_Scan_ToJson().

5.1.1.10 ManualRoi_Scan_ToJson()

```
void ManualRoi_Scan_ToJson (
            const std::string & aInFile,
            const ManualRoI & aManualRoI,
            const ScanConfiguration & aScanConfig,
            const std::string & aOutFile )
```

Manually extract RoI, run scan and dump to JSON file.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aScanConfig	The configuration for the scan
aOutFile	The name of the output JSON file

Definition at line 130 of file API.cpp.

Functions

- template<typename tContainer , typename tExpr , typename T = typename std::remove_reference<tContainer>::type::value_type, typename U = decltype(std::declval<tExpr>().operator()(std::declval<T>()))>
  std::enable_if< not std::is_same< U, void >::value, std::vector< U > >::type operator| (tExpr &&aExpr, tContainer &&aContainer)

    Super nerd template magic emulating list comprehension for function with return type.

- template<typename tContainer , typename tExpr , typename T = typename std::remove_reference<tContainer>::type::value_type, typename U = decltype(std::declval<tExpr>().operator()(std::declval<T>()))>
  std::enable_if< std::is_same< U, void >::value, void >::type operator| (tExpr &&aExpr, tContainer &&a↩Container)

    Super nerd template magic emulating list comprehension for function with void return type.

- template<typename tContainer , typename tType , typename tContainerType = typename std::remove_reference<tContainer>::type↩::value_type>
  std::vector< tType > operator| (tType tContainerType::∗aPtr, tContainer &&aContainer)

    Return a container holding copies of a member-variable from each object in a container.

- std::vector< std::size_t > range (const std::size_t &N)

    Emulate the python range function to generate a vector of ints.

5.11.1 Function Documentation

5.11.1.1 operator"|() [1/3]

```
template<typename tContainer , typename tExpr , typename T = typename std::remove_reference<t↩
Container>::type::value_type, typename U = decltype( std::declval<tExpr>().operator()( std↩
::declval<T>() ) )>
std::enable_if< not std::is_same<U, void>::value, std::vector< U > >::type operator| (
            tExpr && aExpr,
            tContainer && aContainer )  [inline]
```

Super nerd template magic emulating list comprehension for function with return type.

Template Parameters

tContainer	A container type
tExpr	A function-call type
T	Template magic to determine the type of the data in the container
U	Template magic to determine the return-type of the function, given the type of the data in the container

Parameters

aExpr	A function-call to be applied to each element of the container
aContainer	A container holding the arguments to be fed to the expression

Returns

A vector of the results of the vectorized operations

Definition at line 20 of file ListComprehension.hpp.

5.11.1.2 operator"|() [2/3]

```
template<typename tContainer , typename tExpr , typename T = typename std::remove_reference<t↩
Container>::type::value_type, typename U = decltype( std::declval<tExpr>().operator()( std↩
::declval<T>() ) )>
std::enable_if< std::is_same<U, void>::value, void >::type operator| (
            tExpr && aExpr,
            tContainer && aContainer )  [inline]
```

Super nerd template magic emulating list comprehension for function with void return type.

Template Parameters

tContainer	A container type
tExpr	A function-call type
T	Template magic to determine the type of the data in the container
U	Template magic to determine the return-type of the function, given the type of the data in the container

Parameters

aExpr	A function-call to be applied to each element of the container
aContainer	A container holding the arguments to be fed to the expression

Returns

Specialization of the vectorization for functions returning void

Definition at line 39 of file ListComprehension.hpp.

5.11.1.3 operator"|() [3/3]

```
template<typename tContainer , typename tType , typename tContainerType = typename std::remove←
_reference<tContainer>::type::value_type>
std::vector< tType > operator| (
            tType tContainerType::* aPtr,
            tContainer && aContainer ) [inline]
```

Return a container holding copies of a member-variable from each object in a container.

Template Parameters

tType	A container type
tContainerType	Template magic to determine the type of the data in the container

Parameters

aPtr	A pointer-to-member-variable to be applied to each element of the container
aContainer	A container holding the objects whose member variable is to be extracted

Returns

A vector of the results of the vectorized operations

Definition at line 51 of file ListComprehension.hpp.

5.11.1.4 range()

```
std::vector< std::size_t > range (
            const std::size_t & N ) [inline]
```

Emulate the python range function to generate a vector of ints.

Parameters

N	The number of elements

Returns

A vector of ints

Definition at line 70 of file ListComprehension.hpp.

Referenced by LocalizationFile::LocalizationFile(), RoI::Preprocess(), RoI::ScanRT(), and ScanConfiguration::Set↩
SigmaParameters().

    User-defined literals fot nanometer quantities.
- long double operator""_micrometer (long double aVal)

    User-defined literals fot micrometer quantities.
- long double operator""_micrometer (unsigned long long aVal)

    User-defined literals fot micrometer quantities.
- long double StrToDist (const std::string &aStr)

    Convert a string representation to a distance.

Variables

- double nanometer = 1e-9

  Define a constant for converting nanometers to meters.

- double micrometer = 1e-6

  Define a constant for converting micrometers to meters.

- double millimeter = 1e-3

  Define a constant for converting millimeters to meters.

- double meter = 1e-0

  Define a constant for converting meters to meters.

- const std::map< std::string, double > UnitMap

  A map for converting string representations of SI units to scaling factors.

5.14.1 Function Documentation

5.14.1.1 operator""""_micrometer() [1/2]

```
long double operator""_micrometer (
            long double aVal )
```

User-defined literals fot micrometer quantities.

Parameters

aVal	The specified value

Returns

The literal value

Definition at line 39 of file Units.hpp.

References micrometer.

5.14.1.2 operator""""_micrometer() [2/2]

```
long double operator""_micrometer (
            unsigned long long aVal )

Include dependency graph for API.cpp:

Functions

- void _ScanCallback_Json_ (const std::vector< ScanEntry > &aVector, const std::string &aOutFile)

  A callback to dump a scan to a JSON file.

- void _FullScanToSimpleScan_ (RoI &aRoI, const ScanConfiguration &aScanConfig, const std::function< void(const std::vector< ScanEntry > &) > &aCallback)

  A callback to neatly package the scan results for easy consumption.

- void _FullClusterToSimpleCluster_ (RoIproxy &aRoIproxy, const std::function< void(const std::vector< ClusterWrapper > &) > &aCallback)

  A callback to neatly package the scan results for easy consumption.

- void AutoRoi_Scan_FullCallback (const std::string &aInFile, const ScanConfiguration &aScanConfig, const std::function< void(RoIproxy &, const double &, const double &) > &aCallback)

  Automatically extract RoI, run scan and apply a full call-back.

- void AutoRoi_Scan_SimpleCallback (const std::string &aInFile, const ScanConfiguration &aScanConfig, const std::function< void(const std::vector< ScanEntry > &) > &aCallback)

  Automatically extract RoI, run scan and apply a simple call-back.

- void AutoRoi_Scan_ToJson (const std::string &aInFile, const ScanConfiguration &aScanConfig, const std::string &aOutFile)

  Automatically extract RoI, run scan and dump to JSON file.

- void AutoRoi_Cluster_FullCallback (const std::string &aInFile, const double &aR, const double &aT, const std::function< void(RoIproxy &) > &aCallback)

  Automatically extract RoI, clusterize and apply a full call-back.

- void AutoRoi_Cluster_SimpleCallback (const std::string &aInFile, const double &aR, const double &aT, const std::function< void(const std::vector< ClusterWrapper > &) > &aCallback)

  Automatically extract RoI, clusterize and apply a full call-back.

- void ManualRoi_Scan_FullCallback (const std::string &aInFile, const ManualRoI &aManualRoI, const ScanConfiguration &aScanConfig, const std::function< void(RoIproxy &, const double &, const double &) > &aCallback)

Manually extract RoI, run scan and apply a full call-back.

- void ManualRoi_Scan_SimpleCallback (const std::string &aInFile, const ManualRoI &aManualRoI, const ScanConfiguration &aScanConfig, const std::function< void(const std::vector< ScanEntry > &) > &a↵ Callback)

    Manually extract RoI, run scan and apply a simple call-back.

- void ManualRoi_Scan_ToJson (const std::string &aInFile, const ManualRoI &aManualRoI, const ScanConfiguration &aScanConfig, const std::string &aOutFile)

    Manually extract RoI, run scan and dump to JSON file.

- void ManualRoi_Cluster_FullCallback (const std::string &aInFile, const ManualRoI &aManualRoI, const double &aR, const double &aT, const std::function< void(RoIproxy &) > &aCallback)

    Manually extract RoI, clusterize and apply a full call-back.

- void ManualRoi_Cluster_SimpleCallback (const std::string &aInFile, const ManualRoI &aManualRoI, const double &aR, const double &aT, const std::function< void(const std::vector< ClusterWrapper > &) > &a↵ Callback)

    Manually extract RoI, clusterize and apply a full call-back.

5.16.1 Function Documentation

5.16.1.1 _FullClusterToSimpleCluster_()

```
void _FullClusterToSimpleCluster_ (
            RoIproxy & aRoIproxy,
            const std::function< void(const std::vector< ClusterWrapper > &) > & aCallback )
```

A callback to neatly package the scan results for easy consumption.

Parameters

aRoIproxy	The region-proxy containing the clusters
aCallback	The simple callback to be applied

Definition at line 54 of file API.cpp.

References RoIproxy::mData.

Referenced by AutoRoi_Cluster_SimpleCallback(), and ManualRoi_Cluster_SimpleCallback().

5.16.1.2 _FullScanToSimpleScan_()

```
void _FullScanToSimpleScan_ (
            RoI & aRoI,
            const ScanConfiguration & aScanConfig,
            const std::function< void(const std::vector< ScanEntry > &) > & aCallback )
```

A callback to neatly package the scan results for easy consumption.

Parameters

aRoI	The region of interest
aScanConfig	The configuration for the scan
aCallback	The simple callback to be applied

Definition at line 41 of file API.cpp.

References RoIproxy::mLogP, and RoI::ScanRT().

Referenced by AutoRoi_Scan_SimpleCallback(), and ManualRoi_Scan_SimpleCallback().

5.16.1.3 _ScanCallback_Json_()

```
void _ScanCallback_Json_ (
            const std::vector< ScanEntry > & aVector,
            const std::string & aOutFile )
```

A callback to dump a scan to a JSON file.

Parameters

aVector	A vector of scan results
aOutFile	The name of the output JSON file

Definition at line 23 of file API.cpp.

Referenced by AutoRoi_Scan_ToJson(), and ManualRoi_Scan_ToJson().

5.16.1.4 AutoRoi_Cluster_FullCallback()

```
void AutoRoi_Cluster_FullCallback (
            const std::string & aInFile,
            const double & aR,
            const double & aT,
            const std::function< void(RoIproxy &) > & aCallback )
```

Automatically extract RoI, clusterize and apply a full call-back.

Parameters

aInFile	The name of the localization file
aR	The R value of the clusterizer
aT	The T value of the clusterizer
aCallback	The callback to be applied

Definition at line 104 of file API.cpp.

References RoI::Clusterize(), and LocalizationFile::ExtractRoIs().

Referenced by AutoRoi_Cluster_SimpleCallback().

5.16.1.5 AutoRoi_Cluster_SimpleCallback()

```
void AutoRoi_Cluster_SimpleCallback (
            const std::string & aInFile,
            const double & aR,
            const double & aT,
            const std::function< void(const std::vector< ClusterWrapper > &) > & aCallback )
```

Automatically extract RoI, clusterize and apply a full call-back.

Parameters

aInFile	The name of the localization file
aR	The R value of the clusterizer
aT	The T value of the clusterizer
aCallback	The callback to be applied

Definition at line 110 of file API.cpp.

References _FullClusterToSimpleCluster_(), and AutoRoi_Cluster_FullCallback().

5.16.1.6 AutoRoi_Scan_FullCallback()

```
void AutoRoi_Scan_FullCallback (
            const std::string & aInFile,
            const ScanConfiguration & aScanConfig,
            const std::function< void(RoIproxy &, const double &, const double &) > & a↩
Callback )
```

Automatically extract RoI, run scan and apply a full call-back.

Parameters

aInFile	The name of the localization file
aScanConfig	The configuration for the scan
aCallback	The full callback to be applied

Definition at line 84 of file API.cpp.

References LocalizationFile::ExtractRoIs(), and RoI::ScanRT().

5.16.1.7 AutoRoi_Scan_SimpleCallback()

```
void AutoRoi_Scan_SimpleCallback (
            const std::string & aInFile,
            const ScanConfiguration & aScanConfig,
            const std::function< void(const std::vector< ScanEntry > &) > & aCallback )
```

Automatically extract RoI, run scan and apply a simple call-back.

Parameters

aInFile	The name of the localization file
aScanConfig	The configuration for the scan
aCallback	The simple callback to be applied

Definition at line 90 of file API.cpp.

References _FullScanToSimpleScan_(), and LocalizationFile::ExtractRoIs().

Referenced by AutoRoi_Scan_ToJson().

5.16.1.8 AutoRoi_Scan_ToJson()

```
void AutoRoi_Scan_ToJson (
            const std::string & aInFile,
            const ScanConfiguration & aScanConfig,
            const std::string & aOutFile )
```

Automatically extract RoI, run scan and dump to JSON file.

Parameters

aInFile	The name of the localization file
aScanConfig	The configuration for the scan
aOutFile	The name of the output JSON file

Definition at line 96 of file API.cpp.

References _ScanCallback_Json_(), and AutoRoi_Scan_SimpleCallback().

Referenced by BOOST_PYTHON_MODULE(), and main().

5.16.1.9 ManualRoi_Cluster_FullCallback()

```
void ManualRoi_Cluster_FullCallback (
            const std::string & aInFile,
```

```
            const ManualRoI & aManualRoI,
            const double & aR,
            const double & aT,
            const std::function< void(RoIproxy &) > & aCallback )
```

Manually extract RoI, clusterize and apply a full call-back.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aR	The R value of the clusterizer
aT	The T value of the clusterizer
aCallback	The callback to be applied

Definition at line 138 of file API.cpp.

References RoI::Clusterize(), and LocalizationFile::ExtractRoIs().

Referenced by ManualRoi_Cluster_SimpleCallback().

5.16.1.10 ManualRoi_Cluster_SimpleCallback()

```
void ManualRoi_Cluster_SimpleCallback (
            const std::string & aInFile,
            const ManualRoI & aManualRoI,
            const double & aR,
            const double & aT,
            const std::function< void(const std::vector< ClusterWrapper > &) > & aCallback )
```

Manually extract RoI, clusterize and apply a full call-back.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aR	The R value of the clusterizer
aT	The T value of the clusterizer
aCallback	The callback to be applied

Definition at line 144 of file API.cpp.

References _FullClusterToSimpleCluster_(), and ManualRoi_Cluster_FullCallback().

5.16.1.11 ManualRoi_Scan_FullCallback()

```
void ManualRoi_Scan_FullCallback (
            const std::string & aInFile,
```

```
          const ManualRoI & aManualRoI,
          const ScanConfiguration & aScanConfig,
          const std::function< void(RoIproxy &, const double &, const double &) > & a↵
Callback )
```

Manually extract RoI, run scan and apply a full call-back.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aScanConfig	The configuration for the scan
aCallback	The full callback to be applied

Definition at line 118 of file API.cpp.

References LocalizationFile::ExtractRoIs(), and RoI::ScanRT().

5.16.1.12 ManualRoi_Scan_SimpleCallback()

```
void ManualRoi_Scan_SimpleCallback (
          const std::string & aInFile,
          const ManualRoI & aManualRoI,
          const ScanConfiguration & aScanConfig,
          const std::function< void(const std::vector< ScanEntry > &) > & aCallback )
```

Manually extract RoI, run scan and apply a simple call-back.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aScanConfig	The configuration for the scan
aCallback	The simple callback to be applied

Definition at line 124 of file API.cpp.

References _FullScanToSimpleScan_(), and LocalizationFile::ExtractRoIs().

Referenced by ManualRoi_Scan_ToJson().

5.16.1.13 ManualRoi_Scan_ToJson()

```
void ManualRoi_Scan_ToJson (
          const std::string & aInFile,
          const ManualRoI & aManualRoI,
          const ScanConfiguration & aScanConfig,
          const std::string & aOutFile )
```

Manually extract RoI, run scan and dump to JSON file.

Parameters

aInFile	The name of the localization file
aManualRoI	The manually-specified RoI window
aScanConfig	The configuration for the scan
aOutFile	The name of the output JSON file

Definition at line 130 of file API.cpp.

References _ScanCallback_Json_(), and ManualRoi_Scan_SimpleCallback().

Referenced by BOOST_PYTHON_MODULE().

Functions

- double normal_cdf (const double &x, const double &sigma=1, const double &x0=0)

  Evaluate the Gaussian normal_cdf at a given position Copied from the CERN ROOT implementaion, swap ROOT←
  ::Math::erfc and ROOT::Math::erf for the boost::math version.

5.17.1 Function Documentation

5.17.1.1 normal_cdf()

```
double normal_cdf (
          const double & x,
          const double & sigma = 1,
          const double & x0 = 0 )  [inline]
```

Evaluate the Gaussian normal_cdf at a given position Copied from the CERN ROOT implementaion, swap ROOT←
::Math::erfc and ROOT::Math::erf for the boost::math version.

Parameters

x	The position to evaluate the normal_cdf at
sigma	The standard-deviation of the Gaussian
x0	The mean of the Gaussian

Returns

the value of the Gaussian normal_cdf at x

Definition at line 22 of file Cluster.cpp.

Referenced by Cluster::Parameter::alt_log_score(), and Cluster::Parameter::log_score().

Typedefs

- typedef std::array< std::array< int, 512 >, 512 > tArray

  Typedef an array for histogramming a Localization File.

Functions

- void __LoadCSV__ (const std::string &aFilename, std::vector< Data > &aData, const std::size_t &aOffset, int aCount)

  Multithreading handler for loading a chunk of data from CSV file.

- void __RecursiveSearch__ (tArray &aHist, const int &aRoIid, const int &i, const int &j)

  Recursively search histogram for continuously connected regions over threshold.

5.21.1 Function Documentation

5.21.1.1 __LoadCSV__()

```
void __LoadCSV__ (
            const std::string & aFilename,
            std::vector< Data > & aData,
            const std::size_t & aOffset,
            int aCount )
```

Multithreading handler for loading a chunk of data from CSV file.

Parameters

aFilename	The name of the file to open
aData	A vector into which to fill data
aOffset	The offset into the file
aCount	The (approximate) number of bytes to be handled by this handler

Definition at line 23 of file LocalizationFile.cpp.

References nanometer.

Functions

- void ReportClusters (const std::vector< ClusterWrapper > &aClusters)

    Callback to report clusters.
- int main (int argc, char ∗∗argv)

    The main function.

5.24.1 Function Documentation

5.24.1.1 main()

```
int main (
            int argc,
            char ** argv )
```

The main function.

Parameters

argc	The number of commandline arguments
argv	The commandline arguments

Returns

The exit code

Definition at line 28 of file Cluster.cxx.

References AuxConfiguration::ClusterR(), AuxConfiguration::ClusterT(), AuxConfiguration::inputFile(), and ReportClusters().

5.24.1.2 ReportClusters()

```
void ReportClusters (
              const std::vector< ClusterWrapper > & aClusters )
```

Callback to report clusters.

Parameters

aClusters	A vector of clusters

Definition at line 14 of file Cluster.cxx.

Referenced by main().

5.25 src/PythonBindings/PythonBindings.cpp File Reference

Self-contained sourcefile for producing python-bindings.

Include dependency graph for PythonBindings.cpp:
Macros

- #define ADAPT_CALLBACK_CONSTRUCTOR(SIGNATURE) template<> template<> SIGNATURE↩
  ::function< boost::python::object& >(boost::python::object& aCallback) : function([&](auto&&... aArgs){
  aCallback(aArgs...); }) {}

  Helper macro to define a constructor for a std::function of a given signature from a boost::python callback object Using explicit specialization of the class to the specified type and explicit specialization of the constructor to take a boost::python::object (hence two template<>'s at the start), create a generic variadic lambda that captures the boost::python callback object and pass the lambda to a deferred constructor.

- #define FN(X, ...) def(#X , &X , args(__VA_ARGS__))

Helper Macro to simplify defining functions.
- #define ADAPTED_FN(X, ...) def(#X , +Adapted::X , args(__VA_ARGS__))

    Helper Macro to simplify defining functions with python callbacks.
- #define STRUCT_ARG(r, CLASS, ARG) .def_readwrite(BOOST_PP_STRINGIZE(ARG) , &CLASS::ARG)

    Helper Macro to deal with the boilerplate when dealing with structs.
- #define EXPOSE_STRUCT(CLASS, ARGS) class_< CLASS >(#CLASS) BOOST_PP_SEQ_FOR_EACH(STRUCT_ARG , CLASS , ARGS)

    Helper Macro to deal with the boilerplate when dealing with structs.
- #define EXPOSE_VECTOR(CLASS) class_< std::vector< CLASS> >("Vector##CLASS").def(vector_↩ indexing_suite< std::vector< CLASS > >());

    Helper Macro to deal with the boilerplate when dealing with vectors of objects.

Functions

- ADAPT_CALLBACK_CONSTRUCTOR (std::function< void(RoIproxy &, const double &, const double &) >)

    Define a std::function constructor for full scan callback.
- ADAPT_CALLBACK_CONSTRUCTOR (std::function< void(const std::vector< ScanEntry > &) >)

    Define a std::function constructor for simple scan callback.
- ADAPT_CALLBACK_CONSTRUCTOR (std::function< void(RoIproxy &) >)

    Define a std::function constructor for full clusterizer callback.
- ADAPT_CALLBACK_CONSTRUCTOR (std::function< void(const std::vector< ClusterWrapper > &) >)

    Define a std::function constructor for simple clusterizer callback.
- BOOST_PYTHON_MODULE (BayesianClustering)

    Boost Python Wrapper providing bindings for our C++ functions.

Variables

- auto Adapted::AutoRoi_Scan_SimpleCallback = [](const std::string& aInFile , const ScanConfiguration& aScanConfig , const boost::python::object& aCallback){ ::AutoRoi_Scan_SimpleCallback(aInFile , aScan↩ Config , aCallback); }

    Lambda to automatically extract RoI, run scan and apply a simple python callback.
- auto Adapted::AutoRoi_Cluster_SimpleCallback = [](const std::string& aInFile , const double& aR , const double& aT , const boost::python::object& aCallback){ ::AutoRoi_Cluster_SimpleCallback(aInFile , aR , aT , aCallback); }

    Lambda to automatically extract RoI, clusterize and apply a simple python callback.
- auto Adapted::ManualRoi_Scan_SimpleCallback = [](const std::string& aInFile , const ManualRoI& a↩ ManualRoI , const ScanConfiguration& aScanConfig , const boost::python::object& aCallback){ ::Manual↩ Roi_Scan_SimpleCallback(aInFile , aManualRoI , aScanConfig , aCallback); }

    Lambda to manually extract RoI, run scan and apply a simple python callback.
- auto Adapted::ManualRoi_Cluster_SimpleCallback = [](const std::string& aInFile , const ManualRoI& a↩ ManualRoI , const double& aR , const double& aT , const boost::python::object& aCallback){ ::ManualRoi↩ _Cluster_SimpleCallback(aInFile , aManualRoI , aR , aT , aCallback); }

    Lambda to manually extract RoI, clusterize and apply a simple python callback.

5.25.1 Detailed Description

Self-contained sourcefile for producing python-bindings.

5.25.2 Macro Definition Documentation

5.25.2.1 ADAPT_CALLBACK_CONSTRUCTOR

```
#define ADAPT_CALLBACK_CONSTRUCTOR(
              SIGNATURE ) template<> template<> SIGNATURE::function< boost::python::object&
>( boost::python::object& aCallback ) :  function( [&]( auto&&...  aArgs ){ aCallback( a←
Args...  ); } ) {}
```

Helper macro to define a constructor for a std::function of a given signature from a boost::python callback object Using explicit specialization of the class to the specified type and explicit specialization of the constructor to take a boost::python::object (hence two template<>'s at the start), create a generic variadic lambda that captures the boost::python callback object and pass the lambda to a deferred constructor.

Gnarly!

Parameters

SIGNATURE	The signature of the std::function we are creating a constructor for

Definition at line 38 of file PythonBindings.cpp.

5.25.2.2 ADAPTED_FN

```
#define ADAPTED_FN(
              X,
              ...  ) def( #X , +Adapted::X , args( __VA_ARGS__ ) )
```

Helper Macro to simplify defining functions with python callbacks.

Parameters

X	The function being defined
...	List of strings giving argument names

Definition at line 73 of file PythonBindings.cpp.

5.25.2.3 EXPOSE_STRUCT

```
#define EXPOSE_STRUCT(
              CLASS,
              ARGS ) class_< CLASS >( #CLASS ) BOOST_PP_SEQ_FOR_EACH( STRUCT_ARG , CLASS ,
ARGS )
```

Helper Macro to deal with the boilerplate when dealing with structs.

Parameters

CLASS	The Class name
ARGS	One of the arguments

Definition at line 84 of file PythonBindings.cpp.

5.25.2.4 EXPOSE_VECTOR

```
#define EXPOSE_VECTOR(
              CLASS ) class_< std::vector< CLASS> >( "Vector##CLASS" ).def( vector_indexing←
_suite< std::vector< CLASS > >() );
```

Helper Macro to deal with the boilerplate when dealing with vectors of objects.

Parameters

CLASS	The Class name

Definition at line 88 of file PythonBindings.cpp.

5.25.2.5 FN

```
#define FN(
              X,
              ...  ) def( #X , &X , args( __VA_ARGS__ ) )
```

Helper Macro to simplify defining functions.

Parameters

X	The function being defined
...	List of strings giving argument names

Definition at line 68 of file PythonBindings.cpp.

5.25.2.6 STRUCT_ARG

```
#define STRUCT_ARG(
              r,
              CLASS,
              ARG ) .def_readwrite( BOOST_PP_STRINGIZE( ARG ) , &CLASS::ARG )
```

Helper Macro to deal with the boilerplate when dealing with structs.

5.26 src/Scan.cxx File Reference

```
#include "BayesianClustering/API.hpp"
#include "BayesianClustering/Configuration.hpp"
#include <iostream>
```
Include dependency graph for Scan.cxx:
Functions

- int main (int argc, char **argv)

  The main function.

5.26.1 Function Documentation

5.26.1.1 main()

```
int main (
            int argc,
            char ** argv )
```

The main function.

Parameters

argc	The number of commandline arguments
argv	The commandline arguments

Returns

> The exit code

Definition at line 15 of file Scan.cxx.

References AutoRoi_Scan_ToJson(), AuxConfiguration::configFile(), AuxConfiguration::inputFile(), and Aux↩Configuration::outputFile().

#include <sstream>
```
Include dependency graph for Units.cpp:
Functions

- long double StrToDist (const std::string &aStr)

    Convert a string representation to a distance.

Variables

- const std::map< std::string, double > UnitMap { {"nm",nanometer}, {"um",micrometer}, {"mm",millimeter}, {"m",meter} }

    A map for converting string representations of SI units to scaling factors.

5.29.1 Function Documentation

5.29.1.1 StrToDist()

```
long double StrToDist (
            const std::string & aStr )
```

Convert a string representation to a distance.

Parameters

aStr	A string representation of a distance

Returns

The literal value

Definition at line 12 of file Units.cpp.

References UnitMap.

Referenced by ScanConfiguration::FromVector(), and AuxConfiguration::FromVector().

5.30 src/Utilities/Vectorize.cpp File Reference

```
#include "Utilities/Vectorize.hpp"
#include <thread>
```
Include dependency graph for Vectorize.cpp:
Variables

- std::size_t Nthreads = std::thread::hardware_concurrency()
  The number of threads used, initialized to the number of hardware threads.

5.30.1 Variable Documentation

5.30.1.1 Nthreads

```
std::size_t Nthreads = std::thread::hardware_concurrency()
```

The number of threads used, initialized to the number of hardware threads.

Utility variable for the concurrency.

Definition at line 8 of file Vectorize.cpp.
